DCS800 Drive Manuals-List\_j.doc

## Safety instructions

## What this chapter contains

This chapter contains the safety instructions you must follow when installing, operating and servicing the drive. If ignored, physical injury or death may follow, or damage may occur to the drive, the motor or driven equipment. Read the safety instructions before you work on the unit.

## To which products this chapter applies

The information is valid for the whole range of the product DCS800, the converter modules DCS800-S0x size D1 to D7, field exciter units DCF80x, etc. like the Rebuild Kit DCS800-R00-9xxx.

## Usage of warnings and notes

There are two types of safety instructions throughout this manual: warnings and notes. Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advise on how to avoid the danger. Notes draw attention to a particular condition or fact, or give information on a subject. The warning symbols are used as follows:

**Dangerous voltage warning** warns of high voltage which can cause physical injury or death and/or damage to the equipment.

**General danger warning** warns about conditions, other than those caused by electricity, which can result in physical injury or death and/or damage to the equipment.

**Electrostatic sensitive devices warning** warns of electrostatic discharge which can damage the equipment.

## Installation and maintenance work

These warnings are intended for all who work on the drive, motor cable or motor. Ignoring the instructions can cause physical injury or death and/or damage to the equipment.

## WARNING!

- Only qualified electricians are allowed to install and maintain the drive!
- Never work on the drive, motor cable or motor when main power is applied.

Always ensure by measuring with a multimeter (impedance at least 1 Mohm) that:

- 1. Voltage between drive input phases U1, V1 and W1 and the frame is close to 0 V.
- 2. Voltage between terminals C+ and D- and the frame is close to 0 V.
- Do not work on the control cables when power is applied to the drive or to the external control circuits. Externally supplied control circuits may cause dangerous voltages inside the drive even when the main power on the drive is switched off.
- Do not make any insulation resistance or voltage withstand tests on the drive or drive modules.
- Isolate the motor cables from the drive when testing the insulation resistance or voltage withstand of the cables or the motor.
- When reconnecting the motor cable, always check that the C+ and D- cables are connected with the proper terminal.

#### Note:

- The motor cable terminals on the drive are at a dangerously high voltage when the main power is on, regardless of whether the motor is running or not.
- Depending on the external wiring, dangerous voltages (115 V, 220 V or 230 V) may be present on the relay outputs of the drive system (e.g. SDCS-IOB-2 and RDIO).
- DCS800 with enclosure extension: Before working on the drive, isolate the whole drive system from the supply.

## Grounding

These instructions are intended for all who are responsible for the grounding of the drive. Incorrect grounding can cause physical injury, death and/or equipment malfunction and increase electromagnetic interference.

## WARNING!

- Ground the drive, motor and adjoining equipment to ensure personnel safety in all circumstances, and to reduce electromagnetic emission and pick-up.
- Make sure that grounding conductors are adequately sized and marked as required by safety regulations.
- In a multiple-drive installation, connect each drive separately to protective earth (PE ⊕).
- Minimize EMC emission and make a 360° high frequency grounding (e.g. conductive sleeves) of screened cable entries at the cabinet lead-through plate.
- Do not install a drive equipped with an EMC filter to an ungrounded power system or a high resistance-grounded (over 30 ohms) power system.

#### Note:

- Power cable shields are suitable as equipment grounding conductors only when adequately sized to meet safety regulations.
- As the normal leakage current of the drive is higher than 3.5 mA AC or 10 mA DC (stated by EN 50178, 5.2.11.1), a fixed protective earth connection is required.

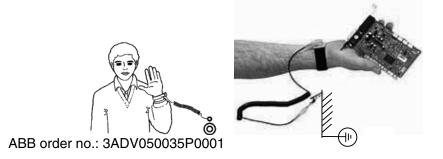

#### Printed circuit boards and fiber optic cables

These instructions are intended for all who handle the circuit boards and fiber optic cables. Ignoring the following instructions can cause damage to the equipment.

**WARNING!** The printed circuit boards contain components sensitive to electrostatic discharge. Wear a grounding wrist band when handling the boards. Do not touch the boards unnecessarily.

Use grounding strip:

**WARNING!** Handle the fiber optic cables with care. When unplugging optic cables, always grab the connector, not the cable itself. Do not touch the ends of the fibers with bare hands as the fiber is extremely sensitive to dirt. The minimum allowed bend radius is 35 mm (1.38 in.).

## **Mechanical installation**

These notes are intended for all who install the drive. Handle the unit carefully to avoid damage and injury.

### WARNING!

 DCS800 sizes D4 ... D7: The drive is heavy. Do not lift it alone. Do not lift the unit by the front cover. Place units D4 and D5 only on its back.

DCS800 sizes D5 ... D7: The drive is heavy. Lift the drive by the lifting lugs only. Do not tilt the unit. The unit will overturn from a tilt of about 6 degrees.

- Make sure that dust from drilling does not enter the drive when installing. Electrically conductive dust inside the unit may cause damage or lead to malfunction.
- Ensure sufficient cooling.
- Do not fasten the drive by riveting or welding.

## Operation

These warnings are intended for all who plan the operation of the drive or operate the drive. Ignoring the instructions can cause physical injury or death and/or damage to the equipment.

# WARNING!

- Before adjusting the drive and putting it into service, make sure that the motor and all driven equipment are suitable for operation throughout the speed range provided by the drive. The drive can be adjusted to operate the motor at speeds above and below the base speed.
- Do not control the motor with the disconnecting device

(disconnecting mains); instead, use the control panel keys and

 $\heartsuit$ , or commands via the I/O board of the drive.

Mains connection

You can use a disconnect switch (with fuses) to disconnect the electrical components of the drive from the mains for installation and maintenance work. The type of disconnect switch used must be as per EN 60947-3, Class B, so as to comply with EU regulations, or a circuit-breaker type which switches off the load circuit by means of an auxiliary contact causing the breaker's main contacts to open. The mains disconnect must be locked in its "OPEN" position during any installation and maintenance work.

- EMERGENCY STOP buttons must be installed at each control desk and at all other control panels requiring an emergency stop function. Pressing the STOP button on the control panel of the drive will neither cause an emergency stop of the motor, nor will the drive be disconnected from any dangerous potential. To avoid unintentional operating states, or to shut the unit down in case of any imminent danger according to the standards in the safety instructions it is not sufficient to merely shut down the drive via signals "RUN", "drive OFF" or "Emergency Stop" respectively "control panel" or "PC tool".
- Intended use

The operating instructions cannot take into consideration every possible case of configuration, operation or maintenance. Thus, they mainly give such advice only, which is required by qualified personnel for normal operation of the machines and devices in industrial installations.

If in special cases the electrical machines and devices are intended for use in non-industrial installations - which may require stricter safety regulations (e.g. protection against contact by children or similar) - these additional safety measures for the installation must be provided by the customer during assembly.

### Note:

• When the control location is not set to Local (L not shown in the status row of the display), the stop key on the control panel will not stop the drive. To stop the drive using the control panel, press the

LOC/REM key and then the stop key  $\widehat{\textcircled{O}}$ .

## Introduction

### **Chapter overview**

This chapter describes the purpose, contents and the intended use of this manual.

#### **Before You Start**

The purpose of this manual is to provide you with the information necessary to control and program the drive.

Study carefully the *Safety instructions* at the beginning of this manual before attempting any work on or with the drive. Read through this manual before starting-up the drive. The installation and commissioning instructions given in the *DCS800 Hardware Manual* and *DCS800 Quick Guide* must also be read before proceeding.

This manual describes the standard DCS800 firmware.

### What this manual contains

The *Safety instructions* can be found at the beginning of this manual.

*Introduction to this manual*, the chapter you are currently reading, introduces you to this manual.

<u>Start-up</u>, this chapter describes the basic start-up procedure of the drive.

*<u>Firmware description</u>*, this chapter describes how to control the drive with **standard** firmware.

<u>I/O configuration</u>, this chapter describes the I/O configuration of digital and analog inputs and outputs with different hardware possibilities.

*Communication*, this chapter describes the communication capabilities of the drive.

<u>Adaptive Program (AP)</u>, this chapter describes the basics of the Adaptive Program and instructs how to build a program.

*Signal and parameter list*, this chapter contains all signals and parameters.

<u>DCS800 Control Panel operation</u>, this chapter describes the handling of the DCS800 Control Panel.

*Fault Tracing*, this chapter describes the protections and fault tracing of the drive.

Appendix A: Firmware structure diagram

Appendix B: SDCS-CON-4 Terminal Allocation

Appendix C: Index of signal and parameters

Introduction to this manual

## Start-up

#### **Chapter overview**

This chapter describes the basic start-up procedure of the drive. A more detailed description of the signals and parameters involved in the procedure can be found in *section <u>Signal and parameter list</u>.* 

#### General

The drive can be operated:

- locally from DriveWindow, DriveWindow Light or DCS800 Control Panel
- respectively remote from local I/O or overriding control.

The following start-up procedure uses DriveWindow (for further information about DriveWindow, consult its online help). However, parameters can also be changed with DriveWindow Light or the DCS800 Control Panel.

The start-up procedure includes actions that need only be taken when powering up the drive for the first time in a new installation (e.g. entering the motor data). After the start-up, the drive can be powered up without using these start-up functions again. The start-up procedure can be repeated later if the start-up data needs to be altered.

Refer to *section <u>Fault tracing</u>* in case problems should arise. In case of a major problem, disconnect mains and wait for 5 minutes before attempting any work on the drive, the motor, or the motor cables.

## Start-up procedure

The <u>Safety Instructions</u> at the beginning of this manual have to be observed with extreme care during the start-up procedure!

The start-up procedure should only be carried out by a qualified electrician.

Check the mechanical and electrical installation the drive according to the *DCS800* Hardware Manual.

### Tools

For drive commissioning following software tools are mandatory:

- DriveWindow Light including commissioning wizard and DWL AP for Adaptive Program and
- DriveWindow for fast drive monitoring using SDCS-COM-8.

For drive commissioning following tools are mandatory in addition to standard tools:

- An oscilloscope including memory function with either galvanically isolating transformer or isolating amplifier for safe measurements.
- A clamp on current probe. In case the scaling of the DC load current needs to be checked it must be a DC clamp on current probe.
- A voltmeter.

Make sure that all equipment in use is suitable for the voltage level applied to the power part!

### Checking with the power switched off

Check the settings of:

- the main breaker (e.g. overcurrent =  $1.6 * I_n$ , short circuit current =  $10 * I_n$ , time for thermal tripping = 10 s),
- time, overcurrent, thermal and voltage relays,
- the earth fault protection (e.g. Bender relay)

Check the insulation of the mains voltage cables or busbars between the secondary side of the dedicated transformer and the drive:

- disconnect the dedicated transformer from its incoming voltage,
- check that all circuits between the mains and the drive (e.g. control / auxiliary voltage) are disconnected,
- measure the insulation resistance between L1 L2, L1 L3, L2 L3, L1 PE, L2 PE, L3 PE,
- the result should be  $M\Omega s$

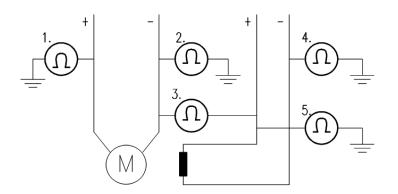

Check the installation:

- crosscheck the wiring with the drawings,
- check the mechanical mounting of the motor and pulse encoder or analog tacho,
- make sure that the motor is connected in a correct way (armature, field, serial windings, cable shields),
- check the connections of the motor fan if existing,
- make sure that the converter fan is connected correctly especially in modules size D6 and D7 were star or delta connection is possible,

- if a pulse encoder is used make sure that pulse encoder's auxiliary voltage connection corresponds to its voltage and that the channel connection corresponds to correct direction of rotation,
- check that the shielding of the pulse encoder's cable is connected to the TE bar of the DCS800,
- if an analog tacho is used make sure that it is connected to the proper voltage input at the SDCS-CON-4:
  - X3:1 X3:4 (90 270 V)
  - X3:2 X3:4 (30 90 V)
  - X3:3 X3:4 (8 30 V)
- for all other cables make sure that both ends of the cables are connected and they do not cause any damage or danger when power is being switched on

Measuring the insulation resistance of the motor cables and the motor:

 isolate the motor cables from the drive before testing the insulation resistance or voltage withstand of the cables or the motor,

Instructions how to measure the insulation resistance

- measure the insulation resistance between:
  - 1. + cables and PE,
  - 2. cables and PE,
  - 3. armature cables and field cables,
  - 4. field cable and PE,
  - 5. field + cable and PE,
- the result should be  $M\Omega s$

Setting of Jumpers:

The boards of the DCS800 include jumpers to adapt the boards to different applications. The position of the jumpers must be checked before connecting voltage. For specific jumper settings consult the *DCS800 Hardware Manual*.

#### Drive data

Check following items for each drive and mark the differences in the delivery documents:

- motor, analog tacho or pulse encoder and cooling fan rating plates data,
- direction of motor rotation,
- maximum and minimum speed and if fixed speeds are used,
- speed scaling factors:
  - e.g. gear ratio, roll diameter,
- acceleration and deceleration times,
- operating modes:
  - e.g. stop mode, E-stop mode,
- the amount of motors connected

#### Checking with the power switched on

There is dangerous voltage inside the cabinet!

Switching the power on:

- prior to connecting the voltage proceed as follows:
  - 1. ensure that all the cable connections are checked and that the connections can't cause any danger,
  - 2. close all doors of enclosed converter before switching power on,
  - 3. be ready to trip the supply transformer if anything abnormal occurs,
  - 4. switch the power on

Measurements made with power on:

- check the operation of the auxiliary equipment,
- check the circuits for external interfaces on site:
  - 1. E-stop circuit,
  - 2. remote control of the main breaker,
  - 3. signals connected to the control system,
  - 4. other signals which remain to be checked

Connecting voltage to the drive:

- check from the delivery diagrams the type of boards and converters which are used in the system,
- check all time relay and breaker settings,
- close the supply disconnecting device (check the connection from the delivery diagrams),
- close all protection switches one at a time and measure for proper voltage

## **Commissioning a DCS800**

Nominal values of the converter can be found in group 4, check following signals:

- ConvNomVolt (4.04), nominal AC converter voltage in V read from TypeCode (97.01) or S ConvScaleVolt (97.03),
- ConvNomCur (4.05), nominal converter DC current in A read from TypeCode (97.01) or S ConvScaleCur (97.02),
- ConvType (4.14), recognized converter type read from TypeCode (97.01),
- *QuadrantType (4.15)*, recognized converter quadrant type read from *TypeCode (97.01)* or *S BlockBrdg2 (97.07)*,
- MaxBridgeTemp (4.17), maximum bridge temperature in degree centigrade read from TypeCode (97.01) or S MaxBrdgTemp (97.04)

If signals are not correct adapt them, see group 97 in this manual.

## Connect DCS800 to PC with DriveWindow Light

- Connect a normal serial cable from the PC COM port to X34 on the drive:

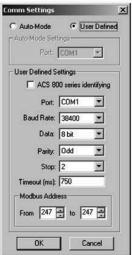

Remove the DCS800 Control Panel if present. Depress the locks to remove the cover

Connect drive (X34) to your PC COM port

- Start DriveWindow Light and check the communication settings:

Example with COM1.

## Commissioning a DCS800 with the wizard

To launch the commissioning wizard start DriveWindow Light and press the Wizard button:

Start the wizard in DriveWin-For basic commissioning press the Start button or select a specific assistant: dow Light: 7. Field weakening ass DriveWindow Light 2 - [Parame 6. ## Commissioning a DCS800 with DriveWindow

## Requirements

- Before starting with the commissioning, connect the drive (via Ch3 on SDCS-COM-8) with DriveWindow (via e.g. NDPA-02 and NDPC-12). All workspaces are 'online' workspaces, thus use *Ch3 NodeAddr (70.22)* = 1.
- 2. The preconfigured workspaces are available from Your local ABB agent or can be found after the DCS800 CD (tools CD) is installed under:

Location of workspaces

## 01, 02 Macro assistant / Name plate data

- 1. Open the workspace 01, 02 DCS800 Name plate data & macro assistant.dww<sup>1</sup>.
- 2. Set all parameters to default by means of *ApplMacro (99.08)* = **Factory** and *ApplRestore (99.07)* = **Yes**. Check with *MacroSel (8.10)*.
- 3. Enter the motor data, the mains (supply) data and the most important protections [*M1SpeedMin* (20.01), *M1SpeedMax* (20.02), *ArmOvrCurLev* (30.09), *M1OvrSpeed* (30.16), Language (99.01), *M1NomVolt* (99.02), *M1NomCur* (99.03), *M1BaseSpeed* (99.04), *NomMainsVolt* (99.10) and *M1NomFldCur* (99.11)].
- 4. After filling out the parameters it is in most cases possible to turn the motor for the first time.
- 5. Select an application macro by means of *ApplMacro (99.08)* = <macro> and *ApplRestore (99.07)* = **Yes**. Check with *MacroSel (8.10)*.

## 03 Autotuning field current controller

- 1. Open the workspace 03 DCS800 Autotuning field current controller.dww<sup>1</sup>.
- 2. Enter the field circuit data [*FldCtrlMode (44.01), M1NomFldCur (99.11)* and *M1UsedFexType (99.12)*].
- 3. Switch the drive to local mode (DriveWindow, DCS800 Control Panel or local I/O).
- 4. Start the autotuning by means of *ServiceMode (99.06)* = **FieldCurAuto** and set **On** within 20 s.
- 5. During the autotuning the main respectively field contactor will be closed, the field circuit is measured by means of increasing the field current to nominal field current and the field current control parameters are set. The armature current is not released while the autotuning is active and thus the motor should not turn.
- 6. When the autotuning is finished successfully, check *M1KpFex (44.02), M1TiFex (44.03)* and *M1PosLimCtrl (45.02)* parameters set by the autotuning for confirmation.
- 7. If the autotuning fails **A121 AutotuneFail** is set. For more details check *Diagnosis (9.11)* and repeat the autotuning.

## 04 Autotuning armature current controller

- 1. Open the workspace 04 DCS800 Autotuning armature current controller.dww<sup>1</sup>.
- 2. Enter the basic current limitations and the motor nominal current [*TorqMax* (20.05), *TorqMin* (20.06), *M1CurLimBrdg1* (20.12), *M1CurLimBrdg2* (20.13) and *M1NomCur* (99.03)].

#### Attention:

Do not change the default values of *M1ArmL (43.09)* and *M1ArmR (43.10)*! Changing them will falsify the results of the autotuning.

- 3. Switch the drive to local mode (DriveWindow, DCS800 Control Panel or local I/O).
- 4. Start the autotuning by means of *ServiceMode (99.06)* = **ArmCurAuto** and set **On** and **Run** within 20 s.
- 5. During the autotuning the main contactor will be closed, the armature circuit is measured by means of armature current bursts and the armature current control parameters are set. The field current is not released while the autotuning is active and thus the motor should not turn, but due to remanence in the field circuit about 40% of all motors will turn (create torque). These motors have to be locked.
- 6. When the autotuning is finished successfully, check *M1KpArmCur* (43.06), *M1TiArmCur* (43.07), *M1DiscontCurLim* (43.08), *M1ArmL* (43.09) and *M1ArmR* (43.10) parameters set by the autotuning for confirmation.
- 7. If the autotuning fails **A121 AutotuneFail** is set. For more details check *Diagnosis (9.11)* and repeat the autotuning.

## 05 Speed feedback assistant

- 1. Open the workspace 05 DCS800 Speed feedback assistant.dww<sup>1</sup>.
- Enter the EMF speed feedback parameters and if applicable the parameters for pulse encoder 1, pulse encoder 2 or the analog tacho [M1SpeedMin (20.01), M1SpeedMax (20.02), M1EncMeasMode (50.02), M1SpeedFbSel (50.03), M1EncPulseNo (50.04), M1TachoVolt1000 (50.13), M1NomVolt (99.02) and M1BaseSpeed (99.04)].
- 3. Switch the drive to local mode (DriveWindow, DCS800 Control Panel or local I/O).
- 4. Start the autotuning by means of *ServiceMode (99.06)* = **SpdFbAssist** and set **On** and **Run** within 20 s.
- 5. The speed feedback assistant detects the kind of speed feedback EMF, pulse encoder 1, pulse encoder 2 or analog tacho the drive is using.
- During the autotuning the main contactor and the field contactor if existing
   - will be closed and the motor will run up to base speed [*M1BaseSpeed* (99.04)]. During the whole procedure the drive will be in EMF speed control
   despite the setting of *M1SpeedFbSel* (50.03).
- 7. When the autotuning is finished successfully, check *M1SpeedFbSel (50.03)* parameter set by the autotuning for confirmation.
- 8. If the autotuning fails **A121 AutotuneFail** is set. For more details check *Diagnosis (9.11)* and repeat the autotuning.

Analog tacho fine tune procedure

- 1. In case an analog tacho is detected [*M1SpeedFbSel (50.03)* = **Tacho**] it is recommended to fine tune the analog tacho.
- 2. Switch the drive to local mode (DriveWindow, DCS800 Control Panel or local I/O).
- 3. Start the autotuning by means of *ServiceMode (99.06)* = **TachFineTune** and set **On** and **Run** within 20 s.
- 4. Measure the motor speed with a hand held tacho and write the value into *M1TachoAdjust (50.12)*.
- 5. Check SpeedActTach (1.05) against SpeedRef4 (2.18).
- 6. Stop the autotuning by removing **Run** and **On** via the DriveWindow control panel.

### 06 Autotuning speed controller

- 1. Open the workspace 06 DCS800 Autotuning speed controller.dww<sup>1</sup>.
- Enter the basic speed, torque and current limits, the speed filter times and the motor base speed [M1SpeedMin (20.01), M1SpeedMax (20.02), TorqMax (20.05), TorqMin (20.06), M1CurLimBrdg1 (20.12), M1CurLimBrdg2 (20.13), SpeedErrFilt (23.06), SpeedErrFilt2 (23.11), SpeedFiltTime (50.06) and M1BaseSpeed (99.04)].
   Attention:

For better results set the filters, especially when using EMF speed feedback.

- 3. Switch the drive to local mode (DriveWindow, DCS800 Control Panel or local I/O).
- 4. Start the autotuning by means of *ServiceMode (99.06)* = **SpdCtrlAuto** and set **On** and **Run** within 20 s.
- 5. During the autotuning the main contactor and the field contactor if existing will be closed, the ramp is bypassed and torque respectively current limits

Start-up

are valid. The speed controller is tuned by means of speed bursts up to base speed [*M1BaseSpeed (99.04)*] and the speed controller parameters are set.

#### Attention:

During the autotuning the torque and/or current limits will be reached.

- 6. When the autotuning is finished successfully, check *KpS (24.03)* and *TiS (24.09)* parameters set by the autotuning for confirmation.
- 7. If the autotuning fails **A121 AutotuneFail** is set. For more details check *Diagnosis (9.11)* and repeat the autotuning.

#### Attention:

The assistant is using the setting of *M1SpeedFbSel (50.03)*. If using setting **Encoder**, **Encoder2** or **Tacho** make sure the speed feedback is working properly!

#### 07 Field weakening assistant

- 1. Open the workspace 07 DCS800 Field weakening assistant.dww<sup>1</sup>.
- Enter the motor data and the field circuit data [M1SpeedMin (20.01), M1SpeedMax (20.02), M1FldMinTrip (30.12), FldCtrlMode (44.01), M1NomVolt (99.02), M1BaseSpeed (99.04) and M1NomFldCur (99.11)].
- 3. Switch the drive to local mode (DriveWindow, DCS800 Control Panel or local I/O).
- 4. Start the autotuning by means of *ServiceMode (99.06)* = **EMF FluxAuto** and set **On** and **Run** via within 20 s.
- 5. During the autotuning the main contactor and the field contactor if existing will be closed and the motor will run up to base speed [*M1BaseSpeed* (99.04)]. The EMF controller data are calculated, the flux linearization is tuned by means of a constant speed while decreasing the field current and the EMF controller respectively flux linearization parameters are set.
- When the autotuning is finished successfully, check KpEMF (44.09), TiEMF (44.10), FldCurFlux40 (44.12), FldCurFlux70 (44.13) and FldCurFlux90 (44.14) parameters set by the autotuning for confirmation.
- 7. If the autotuning fails **A121 AutotuneFail** is set. For more details check *Diagnosis (9.11)* and repeat the autotuning.

<sup>1</sup>: before opening the workspaces, the drive has to be connected to DriveWindow

## Manual tuning

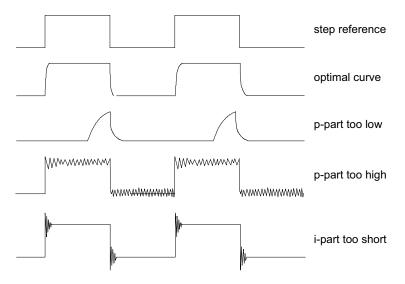

## I/O configuration

To set the in- and outputs see chapter <u>I/O configuration</u>.

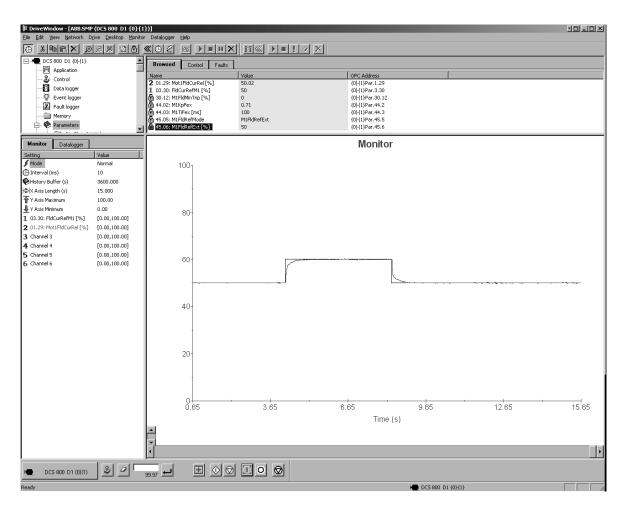

## Field current controller

Manual tuning of the field current controller:

- connect DriveWindow to the drive and choose local mode,
- monitor Mot1FldCurRef (1.29) and FldCurRefM1 (3.30),
- set M1FldMinTrip (30.12) = 0 %,
- set M1FldRefMode (45.05) = M1FldRefExt,
- give **On** via DriveWindow,
- use M1FldRefExt (45.06) to step the field current controller,
- tune the field current controller by means of *M1KpFex (44.02)* and *M1TiFex (44.03)*,
  - steps size: about 2 % 5 % of nominal field current (do not hit any limits during the step and the step response, e.g. max. field current, or supply voltage),
  - $\circ$  step response time: 50 ms 60 ms (count only from 10 % to 90 %),
  - $\circ$   $\,$  where to step: 30 %, 60 % and 80 % of nominal field current,

Field current controller step responses

DriveWindow manual tuning field current controller

- set *M1FldRefExt* (45.06) = 0 %,
- remove **On** via DriveWindow,
- set M1FldMinTrip (30.12) and M1FldRefMode (45.05) back to their original settings

### Armature current controller

Control principle

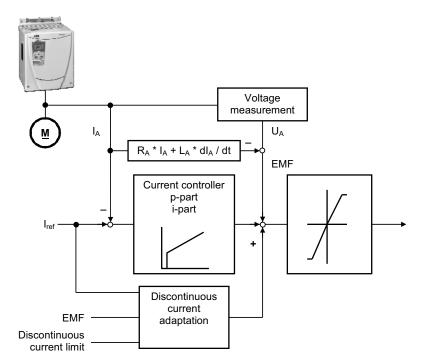

To keep a PI-controller as fast as possible idealistically the integral part should stay at zero. The worst case is that the integral part is running into the limits and thus needs a long time to recover. To prevent this and to achieve an integral part as small as possible two feed forwards are used for the current controller:

- 1. During discontinuous current the signal from the current controller is boosted by means of the discontinuous current adaptation, depending on discontinuous current limit, current reference and EMF. The discontinuous current limit has to be determent during the commissioning.
- 2. Additionally the EMF itself is used as feed forward. Unfortunately it is not possible to measure the EMF directly. It has to be calculated by means of following formula:

Start-up

$$EMF = U_A - (R_A * I_A + L_A * \frac{dI_A}{dt})$$

The values for the resistance  $(R_A)$  and the inductance  $(L_A)$  of the motor have to be determent during the commissioning.

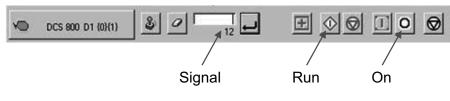

Control principle armature current controller

Thus the manual tuning of the armature current controller has to be splitted into three parts:

- 1. determine resistance and inductance of the motor,
- 2. determine discontinuous current limit of the motor,
- 3. manual tuning of the armature current controller (p- and i-part)

DriveWindow information:

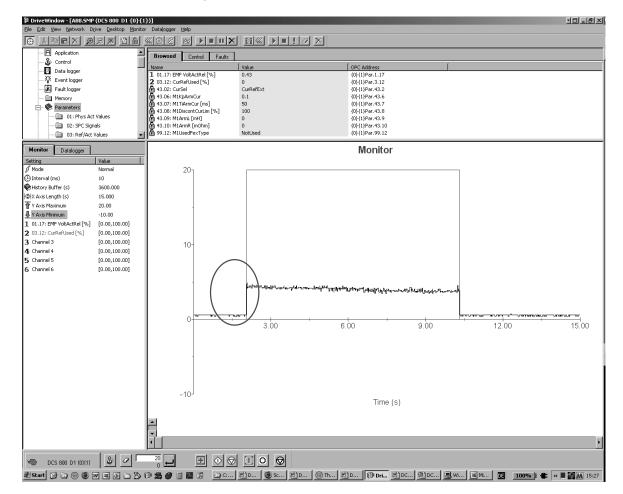

Start-up

Manual

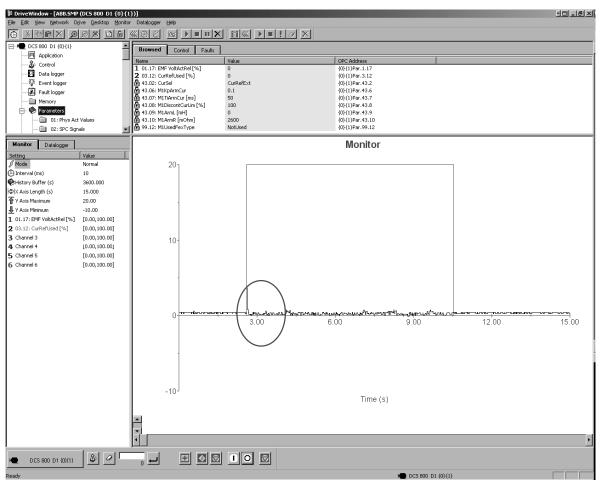

tuning

- Part 1, determine resistance and inductance of the motor:
  - connect DriveWindow to the drive and choose local mode,
  - monitor EMF VoltActRel (1.17) and CurRefUsed (3.12),
  - set CurSel (43.02) = CurRefExt,
  - set M1KpArmCur (43.06), M1TiArmCur (46.07), M1DiscontCurLim (46.08), M1ArmL (43.09) and M1ArmR (46.10) to default,
  - set M1UsedFexType (99.12) = NotUsed,
  - give **On** and **Run** via DriveWindow,
  - use DriveWindow to step the armature current controller and watch the EMF,
  - make sure the motor is not turning (Attention: let the drive run only for a short time),

#### Before tuning of M1ArmL (43.09) and M1ArmR (46.10)

- tune *M1ArmR (46.10)* until the EMF is as close as possible to zero and dose not change it's value during the current step,

After tuning of M1ArmR (46.10)

 It is not possible to tune *M1ArmL (43.09)* manually. Thus set *M1ArmL (43.09)* = 0!

38

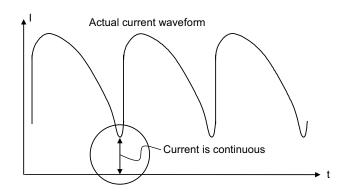

- remove **On** and **Run** via DriveWindow,
- set CurSel (43.02) and M1UsedFexType (99.12) back to their original settings

Part 2, determine discontinuous current limit of the motor:

- connect an oscilloscope to the fixed AO I-act (X4:9 / 10 on the SDCS-CON-4 or X4:5 / 6 on the SDCS-IOB-3),
- connect DriveWindow to the drive and choose local mode,
- set CurSel (43.02) = CurRefExt,
- set M1DiscontCurLim (46.08) to default,
- set M1UsedFexType (99.12) = NotUsed,
- give **On** and **Run** via DriveWindow,
- use DriveWindow to increase the armature current reference,
- make sure the motor is not turning (Attention: let the drive run only for a short time),
- watch the current bubbles and increase the current reference until the current is continuous,

Discontinuous current

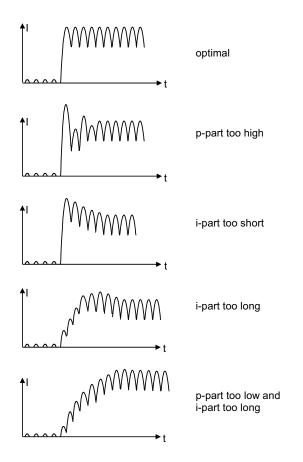

Continuous current

- remove **On** and **Run** via DriveWindow,
- set CurSel (43.02) and M1UsedFexType (99.12) back to their original settings,
- copy the current reference used in DriveWindow and paste it into M1DiscontCurLim (46.08)

Part 3, manual tuning of the armature current controller:

- connect an oscilloscope to the fixed AO I-act (X4:9 / 10 on the SDCS-CON-4 or X4:5 / 6 on the SDCS-IOB-3),
- connect DriveWindow to the drive and choose local mode,
- set CurSel (43.02) = CurRefExt,
- set M1UsedFexType (99.12) = NotUsed,
- give **On** and **Run** via DriveWindow,
- use DriveWindow to step the armature current controller,
- make sure the motor is not turning (Attention: let the drive run only for a short time),
- tune the armature current controller by means of M1KpArmCur (43.06) and M1TiArmCur (46.07),

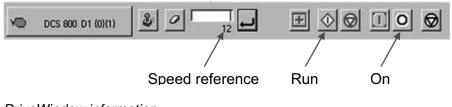

Armature current controller step responses

- remove **On** and **Run** via DriveWindow,
- set CurSel (43.02) and M1UsedFexType (99.12) back to their original settings

## Analog tacho

In case an analog tacho is used for speed feedback it has to be tuned.

DriveWindow information:

tuning

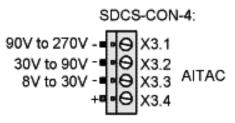

Manual tuning of the analog tacho:

- set speed and analog tacho parameters,
  - M1SpeedMin (20.01),
  - *M1SpeedMax (20.02)*,
  - *M1OvrSpeed (30.16)*,
  - *M1BaseSpeed (99.04)* and
  - tacho voltage at 1000 rpm with *M1TachoVolt1000 (50.13)*,
- the maximum tacho speed is calculated automatically and shown in M1TachoMaxSpeed (88.25),
- the needed tacho connection is calculated automatically and shown in *TachoTerminal (4.25)*,

🖺 04.25: TachoTerminal

X3-1 90-270V

Analog tacho inputs

Analog tacho connections

- check the tacho connections and change them accordingly,
- set *M1TachoTune (88.27)* = 1.000 (default),
- make sure that the drive is in EMF control M1SpeedFbSel (50.03) = EMF,
- give **On** and **Run** via DriveWindow,
- use DriveWindow to set a constant speed reference,
- measure speed actual at the motor shaft using a hand held tacho,
- rescale M1TachoTune (88.27) in small steps, e.g. +/- 0.005 until the speed actual measured at the shaft and the speed actual measured with the analog tacho match, see SpeedActTach (1.05),
- remove On and Run via DriveWindow

## Speed controller

*Basics* When tuning the drive, change one parameter at a time, then monitor the effect on the step response and possible oscillations. The effect of each parameter change must be checked over a wide speed range and not just at one point. The set speed controller values mainly depend on:

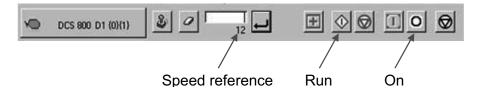

- the relationship between the motor power and the attached masses,
- backlashes and natural frequencies of the attached mechanics (filtering)

The step response tests must be carried out at different speeds, from minimum up to maximum speed, at several different points. The whole speed range must also be tested carefully, e.g. at 25 % - 30 % of maximum speed (step has to be in base

speed range) and 80 % of maximum speed (step has to be in field weakening area) in order to find any oscillation points.

A suitable speed step is about 2 % of maximum speed. A too large step reference or incorrect values of the speed controller might force the drives into torque / current limits, damage the mechanical parts (e.g. gear boxes) or cause tripping of the drive.

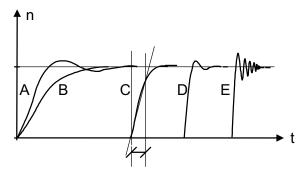

DriveWindow information:

DriveWindow information

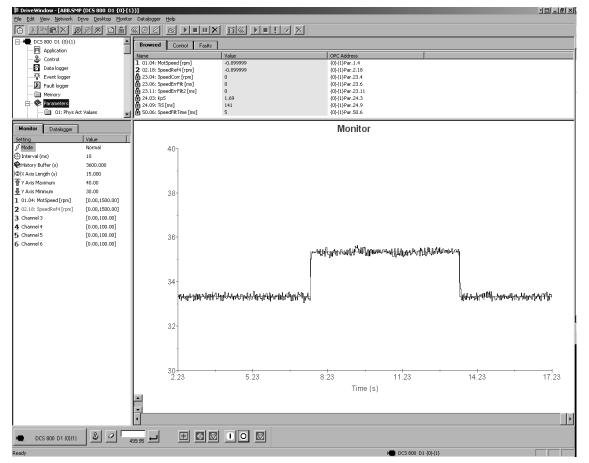

Manual tuning Manual tuning of the speed controller:

- connect DriveWindow to the drive and choose local mode,
- monitor MotSpeed (1.04) and SpeedRef4 (2.18),
- give On and Run via DriveWindow,
- use DriveWindow to set a constant speed reference,
- use *SpeedCorr (23.04)* to step the speed controller,
- tune the speed controller by means of KpS (24.03) and TiS (24.09),
  - steps size: 2 % of maximum speed (do not hit any limits during the step and the step response, e.g. torque or current limits),
  - o disable the i-part by setting TiS(24.09) = 0 ms,
  - o increase KpS (24.03) until the step response shows an overshoot,
  - o decrease *KpS (24.03)* about 30 %,
  - adjust *TiS* (24.09) in such a way, that there is no overshoot or only a slight overshoot, depending on the application (the function of the ipart is to reduce as quickly as possible the difference between speed reference and speed actual),
  - step response time: 100 ms (count only from 10 % to 90 %) in cold mills and 60 ms in rod and bar mills,
  - where to step: 25 % 30 % of maximum speed (step has to be in base speed range) and 80 % of maximum speed (step has to be in field weakening area),
  - filter time •n: e.g. 5 ms 10 ms [see SpeedErrFilt (23.06) and SpeedErrFilt2 (23.11)] or
  - filter time speed actual: e.g. 5 ms 10 ms [see SpeedFiltTime (50.06)],

- A: undercompensated, p-part too small and i-part too short
- B: undercompensated, p-part too small
- C: normal
- D: normal, when a low impact speed drop is required
- E: overcompensated, p-part too large and i-part too short

Speed controller step responses

DriveWindow manual tuning speed controller

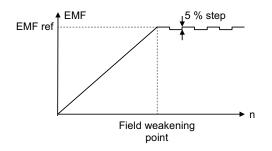

- set SpeedCorr (23.04) = 0 %,
- remove On and Run via DriveWindow

#### **EMF** controller

**Basics** 

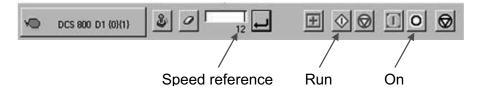

In case the motor needs to be used in the field weakening area the EMF controller has to be tuned. The EMF controller needs to have a quick response. Usually 2 to 3 times slower than the field current controller.

The tuning has to be done in the field weakening area, because the EMF controller is blocked in the base speed range.

EMF reference for manual tuning EMF controller

DriveWindow information:

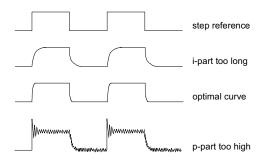

#### DriveWindow information

Manual

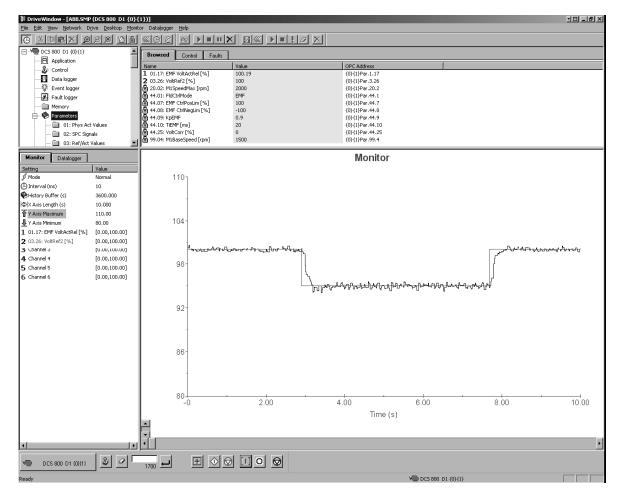

Manual tuning of the EMF controller:

tuning

- connect DriveWindow to the drive and choose local mode, \_
- monitor EMF VoltActRel (1.17) and VoltRef2 (3.26), \_
- set FldCtrlMode (44.01) = EMF,
- set EMF CtrlPosLim (44.07) = 100 %,
- set EMF CtrlNeqLim (44.08) = -100 %,
- give **On** and **Run** via DriveWindow,
- use DriveWindow to set a constant speed reference in the field weakening area.
- use VoltCorr (44.25) to step the EMF controller,
- tune the EMF controller by means of KpEMF (44.09) and TiEMF (44.10),
  - o steps size: 2 % 5 % (do not hit any limits during the step and the step response),
  - step response time: 2 3 times slower than the field current controller,
  - where to step: in the field weakening area, 0

### EMF controller step responses

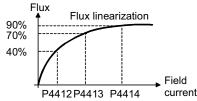

### DriveWindow manual tuning EMF controller

- set VoltCorr (44.25) = 0 %,
- remove **On** and **Run** via DriveWindow.
- set FldCtrlMode (44.01), EMF CtrlPosLim (44.07) and EMF CtrlNegLim (44.08) back to their original settings

#### **Flux linearization**

Basics

In case the motor needs to be used in the field weakening area the flux linearization has to be set. The flux linearization is needed because of the non-linear relation of flux and field current due to saturation effects of the field winding.

Flux of DC-motor versus field current

The magnetization of the motor starts to saturate at a certain field current and thus the flux does not increase linearly. For this reason the field current cannot be directly used to calculate the flux inside the motor.

In base speed area EMF and speed are directly proportional because the flux is kept constant:

$$n = \frac{k * EMF}{\Phi} \qquad k = constant \\ \Phi = Flux$$

Example:

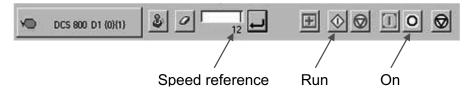

If the nominal armature voltage is 440 V and the motor is running at half speed with full flux, then the armature voltage is about 220 V. Now the flux is reduced to 50 % at constant speed, then the armature voltage drops to about 110 V. Since the EMF is directly proportional to the flux it is possible to define a relationship between the field current and the flux by means of measuring the armature voltage without load (= EMF).

Thus the main idea of the flux linearization is to find field currents which produces desired EMF-voltage at a certain speed. The flux linearization is done by means of a function block defined by 3 values:

- field current at 40 % flux, FldCurFlux40 (44.12),
- field current at 70 % flux, FldCurFlux70 (44.13),
- field current at 90 % flux, *FldCurFlux90 (44.14)*

The intermediate values are interpolated. During commissioning all 3 parameters must be set, if the flux linearization is needed.

DriveWindow information:

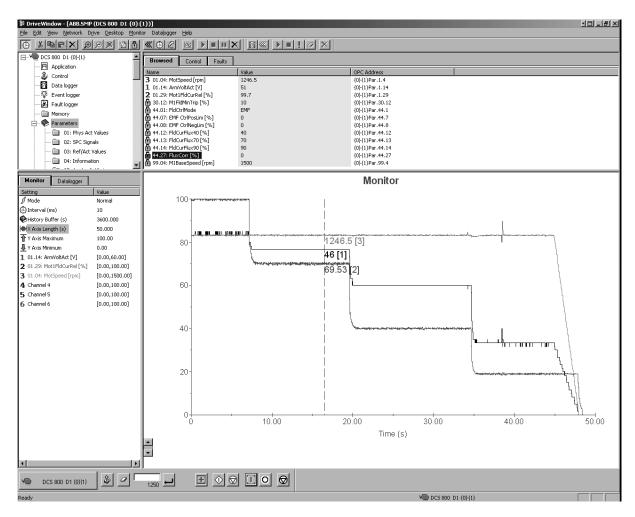

DriveWindow information

Manual

tuning

- Manual tuning of the flux linearization:
  - connect DriveWindow to the drive and choose local mode,
  - make sure the speed feedback device is either encoder or analog tacho -M1SpeedFbSel (50.03) = Encoder or Tacho - and not EMF!
  - monitor MotSpeed (1.04), ArmVoltAct (1.14) and Mot1FldCurRel (1.29),
  - set *M1FldMinTrip* (30.12) = 10 %,
  - set FldCtrlMode (44.01) = EMF,
  - set EMF CtrlPosLim (44.07) = 0 %,
  - set EMF CtrlNegLim (44.08) = 0 %,
  - set FldCurFlux40 (44.12), FldCurFlux70 (44.13) and FldCurFlux90 (44.14) to default,
  - give **On** and **Run** via DriveWindow,
  - use DriveWindow to run the motor at e.g. half base speed,
  - make sure, that the motor is running without load,
  - read ArmVoltAct (1.14), e.g. the measured value is 220 V,
  - reduce the flux with *FluxCorr (44.27)* until *ArmVoltAct (1.14)* reaches 90 % of the 1<sup>st</sup> measurement,
  - read the value of *Mot1FldCurRel (1.29)*, keep it in mind and write it into *FldCurFlux90 (44.14)* after this procedure is finished,
  - reduce the flux with *FluxCorr (44.27)* until *ArmVoltAct (1.14)* reaches 70 % of the 1<sup>st</sup> measurement,
  - read the value of *Mot1FldCurRel (1.29)*, keep it in mind and write it into *FldCurFlux70 (44.13)* after this procedure is finished,
  - reduce the flux with *FluxCorr (44.27)* until *ArmVoltAct (1.14)* reaches 40 % of the 1<sup>st</sup> measurement,
  - read the value of *Mot1FldCurRel (1.29)*, keep it in mind and write it into *FldCurFlux40 (44.12)* after this procedure is finished,

DriveWindow manual tuning flux linearization

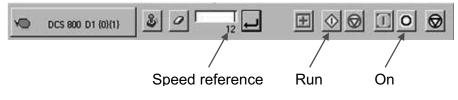

- set FluxCorr (44.27) = 0 %,
- remove **On** and **Run** via DriveWindow,
- set FldCurFlux90 (44.14), FldCurFlux70 (44.13) and FldCurFlux40 (44.12) to the determined values,
- set M1FldMinTrip (30.12), FldCtrlMode (44.01), EMF CtrlPosLim (44.07) and EMF CtrlNegLim (44.08) back to their original settings

## **Thyristor diagnosis**

Basics

- Thyristor diagnosis basically provides two possibilities:
  - 1. check all thyristors of the drive for proper function or
  - 2. check individual firing pulses

DriveWindow information:

DriveWindow information

Check all thyristors

Thyristor diagnosis for all thyristors:

- connect DriveWindow to the drive and choose local mode,
- set ServiceMode (99.06) = ThyDiagnosis,
- set TestFire (97.28) = Off,
- give **On** and **Run** via DriveWindow,

DriveWindow - [ABB.SMP (DCS 800 D1 {0}{1	})]		
<u>File Edit View Network Drive Desktop Monitor</u>	Datalogger <u>H</u> elp		
DCS 800 D1 {0}{1}	Browsed Control Faults		
Application	Name	Value	OPC Address
Control	09.11: Diagnosis		{0}{1}Par.9.11
	97.28: TestFire	Off	{0}-{1}Par.97.28
	🗿 99.06: ServiceMode	ThyDiagnosis	{0}{1}Par.99.6
Memory			
Parameters			Þ
DCS 800 D1 {0}{1}	3.97 • • • • •		
Ready	M DCS 800 D1 {0	}{1}	

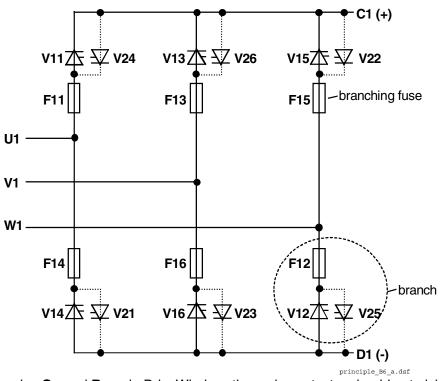

The main contactor is closed and the thyristor diagnosis is started. After the thyristor diagnosis is finished:

- the result is written into Diagnosis (9.11),
- the ServiceMode (99.06) is automatically set back to NormalMode and
- the drive is automatically switched off.

Check individual firing pulses

Start-up

- Check individual firing pulses:
  - make sure, that the main contactor cannot close (e.g. disconnect the digital output controlling the main contactor) or that the mains voltage is off (e.g. high voltage breaker is open),
  - connect a current clamp to one of the firing pulse cables,
  - connect DriveWindow to the drive and choose local mode,
  - set ServiceMode (99.06) = ThyDiagnosis,
  - set *TestFire (97.28)* = V11, ..., V26 depending individual firing pulse to be checked,

- give **On** and **Run** via DriveWindow, the main contactor should not pick up,
- make sure, that the mains voltage is zero,
- check the firing pulse with the current clamp,
- remove **On** and **Run** via DriveWindow,
- set ServiceMode (99.06) back to NormalMode,

TestFire (97.28) is automatically set back to Off.

# **Chapter overview**

This chapter describes how to control the drive with standard firmware.

### Identification of the firmware versions

The DCS800 is controlled by the SCDS-CON-4. The firmware version and type can be checked from:

- FirmwareVer (4.01) and
- FirmwareType (4.02)

The DDCS communication is handled by the SDCS-COM-8. The firmware revision can be checked from:

- Com8SwVersion (4.11)

The firmware revisions of the field exciters can be checked from:

- Mot1FexSwVer (4.08) and
- Mot2FexSwVer (4.09)

# Start / stop sequences

### General

The drive is controlled by control words [*MainCtrlWord* (7.01) or *UsedMCW* (7.04)]. The *MainStatWord* (8.01) provides the hand shake and interlocking for the overriding control.

The overriding control uses the *MainCtrlWord* (7.01) or hardware signals to command the drive. The actual status of the drive is displayed in the *MainStatWord* (8.01).

The marks (e.g.  $\bullet$ ) describe the order of the commands according to Profibus standard. The overriding control can be:

- AC 800M via DDCS communication,
- serial communication (e.g. Profibus),
- hardware signals see CommandSel (10.01) = Local I/O,
- master-follower communication,
- Adaptive Program or
- application program.

### Switch on sequence

Start inhibit		1	x	x	x	x	x	x	x	x	0	x	1140	0474

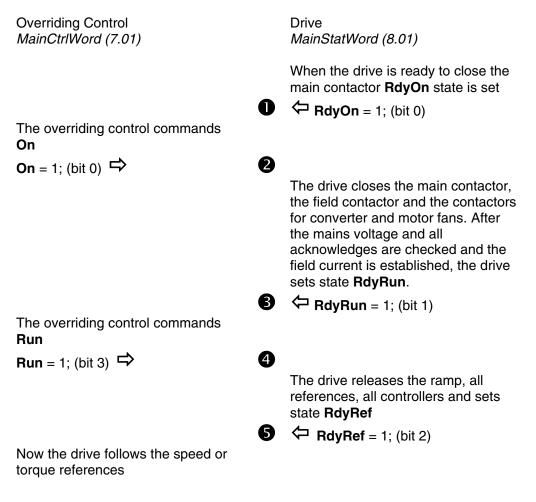

Examples for the MainCtrlWord (7.01)

#### Start the drive

The start sequence given below is only valid for *MainContCtrlMode (21.16)* = **On**.

#### Attention:

All signals have to be maintained. **On**- and **Run** [*MainCtrlWord* (7.01) bit 0 and 1] commands are only taken over with their rising edges.

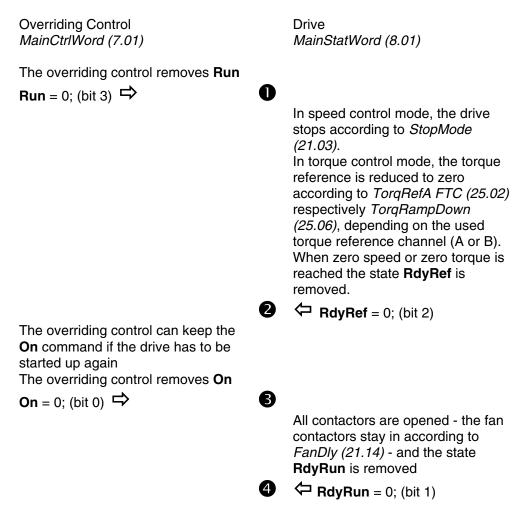

#### Note:

To give **On** and **Run** at the same time set OnOff1 (10.15) = StartStop (10.16).

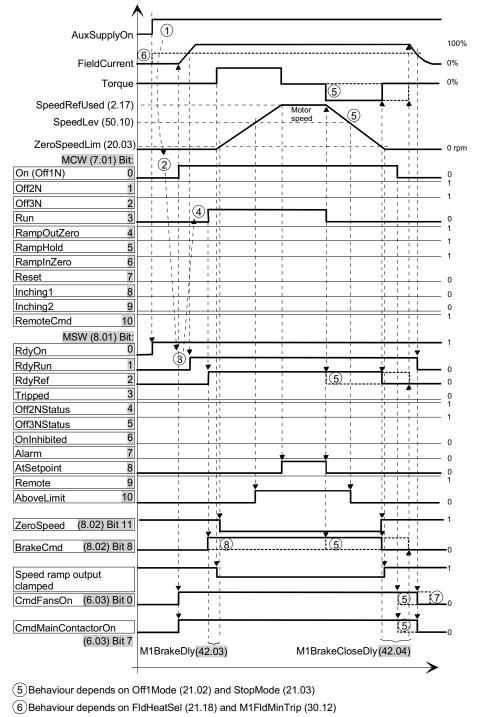

#### Stop the drive

The drive can be stopped in two ways, either by taking away the **On** command directly which opens all contactors as fast as possible after stopping the drive according to *Off1Mode (21.02)* or by means of the following sequence:

Besides in *MainStatWord* (8.01), the drive's state is shown in *DriveStat* (8.08).

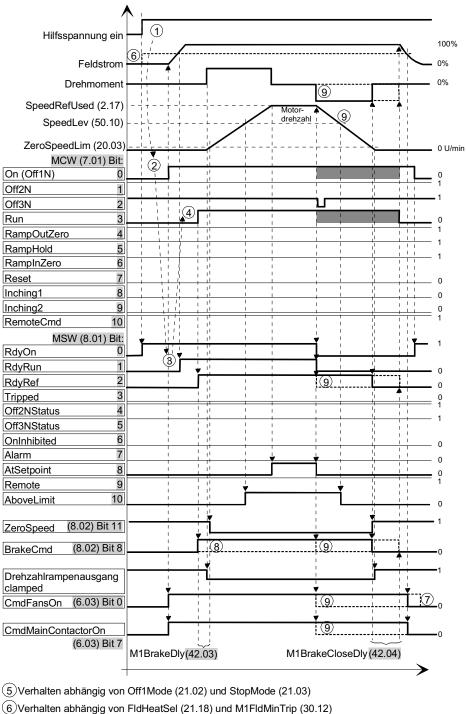

7 Behaviour depends on FanDly (21.14)

# **Field excitation**

### General

Depending on the application the DCS800 has the capability to use several different kinds of field exciters or combinations of them. The differences of the field exciters and their functions are explained here.

## **Field Reversal**

Changing the field current direction is needed when the armature converter has only one bridge (2-quadrant). Field reversal is changing the direction of the field current. Thus the direction of the speed is changing and it is possible to regenerate energy back into the mains. For example to decelerate a large inertia. To initiate the field reversal the sign of *TorqRefUsed (2.13)* is taken and defines the desired direction of the field current. Armature converters with two anti-parallel bridges (4-quadrant) do not require field reversal.

Overview field reversal and optitorque

Field control

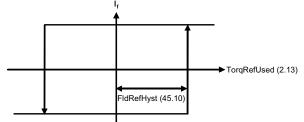

Field reversal is activated by means of *FldCtrlMode (44.01)*:

Mode	Functionality	Armature converter
Fix	constant field (no field weakening), EMF controller blocked, field reversal blocked, optitorque blocked, default	2-Q or 4-Q
EMF	field weakening active, EMF controller released, field reversal blocked, optitorque blocked	2-Q or 4-Q
Fix/Rev	constant field (no field weakening), EMF controller blocked, <b>field reversal active</b> , optitorque blocked	2-Q
EMF/Rev	field weakening active, EMF controller released, field reversal active, optitorque blocked	2-Q
Fix/Opti	constant field (no field weakening), EMF controller blocked, field reversal blocked, <b>optitorque active</b>	2-Q or 4-Q
EMF/Opti	field weakening active, EMF controller released, field reversal blocked, <b>optitorque active</b>	2-Q or 4-Q
Fix/Rev/Opti	constant field (no field weakening), EMF controller	2-Q

	blocked, field reversal active, optitorque active	
EMF/Rev/Opti	field weakening active, EMF controller released,	2-Q
-	field reversal active, optitorque active	

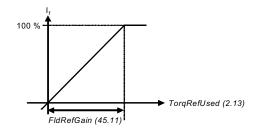

Field reference hysteresis

To prevent field reversal from continuous toggling due to a too small torque reference, a torque reference hysteresis is available. The hysteresis is symmetrical and is set by *FldRefHyst (45.10)*:

## Field reference hysteresis

Force field current direction	With <i>ForceFldDir (45.07)</i> it is possible to force and clamp the field current direction. This gives the user the possibility to control the field current direction or change it in case of need. Thus unnecessary field current changes at low torque are prevented and it is also possible to release field reversal for certain occasions, e.g. jogging or E-stop.
Reversal time	The physical reversal time can be reduced by increasing the input voltage of the field exciter and using Optitorque. Please note that the output voltage of the field exciter is limited by means of <i>M1PosLimCtrl (45.02)</i> or <i>M2PosLimCtrl (45.16)</i> . This can also increase the physical reversal time.
Bumpless transition	The output of the speed ramp is updated by means of the actual speed to ensure a bumpless transition, if <i>RevDly (43.14)</i> is greater than 25 ms and <i>RevMode (43.16)</i> = <b>Soft</b> .
Optitorque	Due to high inductances of motors, the field reversal takes a relatively long time. In certain cases this time can be reduced by means of optitorque - see <i>FldCtrlMode</i> (44.01). In case the process requires only a small torque during field reversal, the field current is decreased and the armature current is increased prior to the field current change. This speeds up the field reversal. The rate of the field current reduction depends on the process. E.g. if the speed direction is changed rather slowly, the required torque may also be quite small. This allows the reduction of the field current. Thus by means of optitorque it is possible to shorten the field reversal time.

Field current reference gain

For example with *FldRefGain* (45.11) = 20 %, 100 % field current is generated at *TorqRefUsed* (2.13) = 20 %.

## Field current monitoring

	During normal operation the field current is compared with <i>M1FldMinTrip (30.12)</i> .
Field	The drive trips with <b>F541 M1FexLowCur</b> [ <i>FaultWord3 (9.03)</i> bit 8] if the field
minimum trip	current drops below this limit and is still undershot when <i>FldMinTripDly (45.18)</i> is
	elapsed.
	During field reversal the situation is different. <i>M1FldMinTrip (30.12)</i> is disabled for
	FldCtrlMode (44.01) = Fix/Opti, EMF/Opti, Fix/Rev/Opti or EMF/Rev/Opti. In this
	case the trip level is automatically set to 50 % of FldCurRefM1 (3.30). The drive
	trips with F541 M1FexLowCur [FaultWord3 (9.03) bit 8] if 50 % of FldCurRefM1
	(3.30) is still undershot when <i>FldMinTripDly (45.18)</i> is elapsed.
	If actual flux and armature voltage of the motor cannot follow the field current
Flux reversal	during field reversal it is necessary to delay the active field direction.
	FluxRevMonDly (45.08) is the maximum allowed time within Mot1FldCurRel (1.29)
	and the internal motor flux doesn't correspond to each other during field reversal.
	During this time <b>F522 SpeedFb</b> [ <i>FaultWord2 (9.02)</i> bit 5] is disabled.
Field very even	The sign of <i>Mot1FldCurRel (1.29)</i> is used to generate the field reversal
Field reversal hysteresis	acknowledge. To avoid signal noise problems a small hysteresis - defined by
11931616313	means of <i>FldRevHyst (45.09)</i> - is needed.
	While the field reversal is in progress - see CurCtrlStat2 (6.04), bit 11,
Field reversal active	<ul> <li>the current controller is blocked,</li> </ul>
active	<ul> <li>the I-part of the speed controller frozen,</li> </ul>
	<ul> <li>the output of the speed ramp is updated by means of the actual speed, if</li> </ul>
	<i>RevDly (43.14)</i> is greater than 25 ms and <i>RevMode (43.16)</i> = <b>Soft</b>

-	<i>RevDly (43.14)</i> is greater than 25 ms and <i>RevMode (43.16)</i> = <b>Soft</b> Field heating (also referred to as "field warming and field economy") is used for a couple of reasons. Previous generations of DC-drives used voltage-controlled field supplies, meaning that the only thing the field supply could directly control was the field voltage. For DC-motors to maintain optimal torque it is important to maintain the field current. Ohm's law (U = R*I) tells us that voltage equals resistance multiplied by current.
-	<ul> <li>RevDly (43.14) is greater than 25 ms and RevMode (43.16) = Soft</li> <li>Field heating (also referred to as "field warming and field economy") is used for a couple of reasons.</li> <li>Previous generations of DC-drives used voltage-controlled field supplies, meaning that the only thing the field supply could directly control was the field voltage. For DC-motors to maintain optimal torque it is important to maintain the field current.</li> </ul>

higher field current than a warm motor, even though voltage remained unchanged. To keep the resistance and thus the current constant, the field was left on to keep it warm. Then the voltage-controlled field supply works just fine.

The new generation of drives, including all field supplies used with the DCS800, are current controlled. Thus the field supply directly controls field current. This means that field heating may no longer be necessary when the DCS800 is employed.

Another reason field heating is used is to keep moisture out of the motor. Following parameters are used to turn on and control field heating:

- FldHeatSel (21.18),
- M1FldHeatRef (44.04)

Modes of operation

There are basically two modes of operation. In both modes, the field current will be at a reduced level, determined by *M1FldHeatRef (44.04)*.

*FldHeatSel (21.18)* = **On**:

Field heating is on, as long as On = 0 [UsedMCW (7.04) bit 0], Off2N = 1 [UsedMCW (7.04) bit 1] and Off3N = 1 [UsedMCW (7.04) bit 2].
 In general, field heating will be on as long as the OnOff input is not set and no Coast Stop or E-stop is pending.

Condition	<b>On</b> [ <i>UsedMCW</i> (7.04) bit 0]	Off2N [ <i>UsedMCW</i> (7.04) bit 1]*	Result
Power up	0	1	reduced field current**
Start drive	1	1	normal field current
Normal stop	1 → 0	1	normal field current, then reduced** after stop
Coast Stop while running	1	1 → 0	field is turned off as motor coasts to stop and cannot turned back on again as long as Coast Stop is pending

\*see Off2 (10.08)

\*\*the field current will be at the level set by means of *M1FldHeatRef (44.04)* while motor is stopped

#### FldHeatSel (21.18) = OnRun:

Field heating is on as long as On = 1, Run = 0 [UsedMCW (7.04) bit 3],
 Off2N = 1 and Off3N = 1.

In general, field heating will be on as long as the OnOff input is set, the Start/Stop input is not set and no Coast Stop or E-stop is pending.

<b>On</b> [ <i>UsedMCW</i> (7.04) bit 0]	Run [ <i>UsedMCW</i> (7.04) bit 3]	Off2N [ <i>UsedMCW</i> (7.04) bit 1]*	Result
0	х	х	field is turned off
1	0	1	reduced field current**
1	1	1	normal field current
1	1 → 0	1	normal field current, then reduced** after stop

1	x	1 → 0	field is turned off as motor coasts to stop and cannot turned back on again as long as
			Coast Stop is pending

\*see Off2 (10.08)

\*\*the field current will be at the level set by means of *M1FldHeatRef (44.04)* while motor is stopped

*E-stop* In both modes of operation, if the E-stop - see *E Stop (10.09)* - is pending the field will be turned off. It cannot be turned back on again as long as the E-stop is pending. If the E-stop is cleared while in motion, the motor will be stopped according to *E StopMode (21.04)* and then field and drive will be turned off.

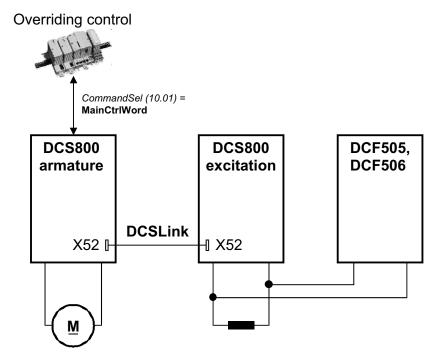

## Field exciter mode

### General

The standard DCS800 module can be operated as large field exciter by simply setting parameters. It is either controlled by a DCS800 armature converter or can be configured as stand alone field exciter.

The field exciter mode uses the standard armature current controller as field current controller. Thus the current of the converter [*ConvCurAct (1.16)*] equals the field current of the motor. For these configurations an overvoltage protection (DCF505 or DCF506) is mandatory.

## Large field exciter controlled by a DCS800 armature converter

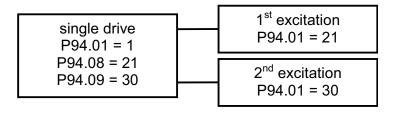

Communication in field exciter mode

Large field exciters are fully controlled via the DCSLink:

DCSLinkNodelD (94.01) = 1, default M1FexNode (94.08) = 21, default M2FexNode (94.09) = 30, default

Single drive with one or two large field exciters:

In the large field exciters set *OperModeSel* (43.01) = **FieldConv** and *CommandSel* (10.01) = **FexLink** as source for the control word (**OnOff1**, **StartStop** and **Reset**). The reference is selected by *CurSel* (43.02) = **FexCurRef**. In the armature converter the field current is set by means of *M1NominalFldCur* (99.11) and in the large field exciter the current is set by means of *M1NomCur* (99.03). To close the field contactor use *CurCtrlStat1* (6.03) bit 7.

Parameters to be set in the DCS800 armature converter:

Parameter	Armature converter	Comments
M1FldMinTrip (30.12)	xxx %	sets level for F541 M1FexLowCur
FldCtrlMode (44.01)	1 = <b>EMF</b>	EMF controller released, field weakening
		active - depending on the application
FldMinTripDly (45.18)	2000 ms (def.)	delays F541 M1FexLowCur
DCSLinkNodeID (94.01)	1	
FexTimeOut (94.07)	100 ms (def.)	causes F516 M1FexCom
M1FexNode (94.08)	21 (def.)	Use the same node number as in
		DCSLinkNodeID (94.01) of the field exciter
M1NomFldCur (99.11)	xxx A	$I_{EN} = xxx A$ , rated field current
M1UsedFexType (99.12)	8 = <b>DCS800-S01</b> ,	
	9 = <b>DCS800-S02</b>	

Parameters to be set in large field exciters:

Before starting with the commissioning set all parameters to default by means of *ApplMacro (99.08)* = **Factory** and *ApplRestore (99.07)* = **Yes**. Check with *MacroSel (8.10)*.

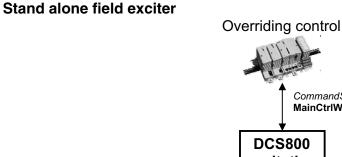

Parameter	Field converter	Comments
CommandSel (10.01)	4 = FexLink	
MotFanAck (10.06)	0 = NotUsed	
OvrVoltProt (10.13)	2 = <b>DI2</b>	depending on hardware connection to DCF506
ArmOvrVoltLev (30.08)	500 %	to suppress <b>F503 ArmOverVolt</b> if this does not help, increase <i>M1NomVolt (99.02)</i>
OperModeSel (43.01)	1 = FieldConv	
CurSel (43.02)	8 = FexCurRef	
M1DiscontCurLim (43.08)	0 %	
RevDly (43.14)	50 ms	
FldCtrlMode (44.01)	0 = <b>Fix</b> (def.)	

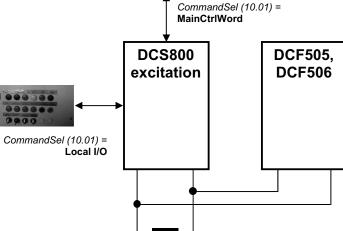

DCSLinkNodeID (94.01)	21 (def.)	Use the same node number as in <i>M1FexNode</i> (94.08) of the armature module
DevLimPLL (97.13)	20 °	to suppress blocking of current controller see <i>CuCtrlStat2 (6.04)</i> bit 13
M1NomVolt (99.02)	xxx V	$U_{FN} = xxx V$ , rated field voltage
M1NomCur (99.03)	xxx A	$I_{EN} = xxx A$ , rated field current
NomMainsVolt (99.10)	xxx V	U <sub>NetN</sub> = xxx V; nominal supply voltage (AC)
M1UsedFexType (99.12)	0 = NotUsed	

Field current autotuning for large field exciters:

The field current autotuning has to be started directly in the large field exciter:

Parameter	Field converter	Comments
ServiceMode (99.06)	2 = FieldCurAuto	Give the <b>On</b> and <b>Run</b> command within 20 s
M1KpArmCur (43.06)	XXX	Is set by field current autotuning
M1TiArmCur (43.07)	XXX	Is set by field current autotuning
M1DiscontCurLim (43.08)	0 %	Is set to zero by field current autotuning

### Stand alone field exciter

In the stand alone field exciters set *OperModeSel* (43.01) = **FieldConv** and *CommandSel* (10.01) = **Local I/O** or **MainCtrlWord** as source for the control word (**OnOff1**, **StartStop** and **Reset**). The reference is selected by *CurSel* (43.02) = **CurRefExt** or **Al1** to **Al6**. The field exciter mode uses the standard armature current controller as field current controller. Thus the field current is set by means of *M1NomCur* (99.03).

To close the field contactor use CurCtrlStat1 (6.03) bit 7.

Parameters to be set in the stand alone field exciter:

Before starting with the commissioning set all parameters to default by means of *ApplMacro (99.08)* = **Factory** and *ApplRestore (99.07)* = **Yes**. Check with *MacroSel (8.10)*.

Parameter	Field converter	Comments
CommandSel (10.01)	0 = Local I/O (def.),	
	1 = MainCtrlWord	
MotFanAck (10.06)	0 = NotUsed	
OvrVoltProt (10.13)	2 = <b>DI2</b>	depending on hardware connection to DCF506

# **DC-breaker**, **DC-contactor**

### General

The DC-breaker is used to protect the DC-motor or - in case of too low mains voltage or voltage dips - the generating bridge of the drive from overcurrent. In case of an overcurrent the DC-breaker is forced open by its own tripping spring. DC-breakers have different control inputs and trip devices:

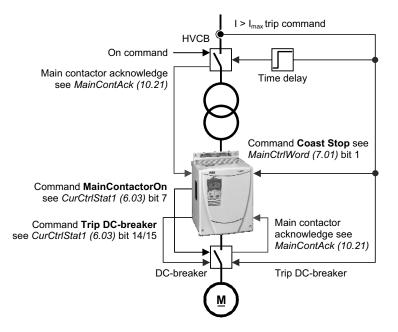

- an On / Off coil with a typical time delay of 100 to 200 ms,
- a high speed tripping coil (e.g. Secheron = CID) to trip the DC-breaker within 2 ms from e.g. the drive,
- an internal tripping spring which is released by overcurrent and set mechanically

There are different ways how to control the DC-breaker depending on the available hardware and the customers on / off philosophy. Following are the most common examples.

### Attention:

If a DC breaker is used and DC voltage measurement is taken inside the converter module (D1 – D4 modules and D5 – D7 in default configuration) then deselect the automatic offset compensation by setting *OffsetUDC* (97.24) = 0

## HVCB controlled externally, DC-breaker controlled by the drive

HVCB controlled externally, DC-breaker controlled by the drive

68

In the above example the **H**igh **V**oltage **C**ircuit **B**reaker (HVCB) is controlled externally (e.g. by the operator). The result is checked by means of *MainContAck* (10.21). In case the main contactor acknowledge is missing **F524 MainContAck** [*FaultWord2 (9.02)* bit 7] is set. Usually HVCB are equipped with an overcurrent relay, which can trip the HVCB. To protect the drive a 50 ms to 100 ms pre-triggered trip command must be connected to **Off2** (Coast Stop) [*MainCtrlWord* (7.01) bit 1]. Additionally the trip command from the HVCB should also trip the DC-breaker.

DC-breaker is controlled by the drive. The drive closes and opens the DC-breaker with the command **MainContactorOn**. The result is checked by means of *MainContAck (10.21)*. In case the main contactor acknowledge is missing **F524 MainContAck** [*FaultWord2 (9.02)* bit 7] is set.

The DC-breaker can be tripped actively by the command Trip DC-breaker.

## **DC-contactor US version**

If using a DC contactor, you must connect an auxiliary contact to a digital input of your choice and set para. *MainContAck* accordingly. Set the following parameters: MainContAck (10.21) = DI1 (or any input you choose for the DC cont.

MainContAck (10.21)	=	<b>DI1</b> (or any input you choose for the E auxiliary contact)
DO8BitNo (14.16)	=	10
MainContCtrlMode (21.16)	=	DCcontact (3)

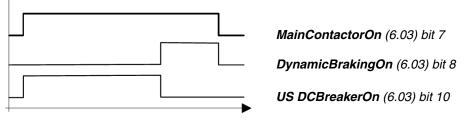

Set these parameters AFTER macros are loaded but BEFORE the drive is commissioned.

Digital output 8 (DO8) must be used to turn the DC-contactor on and off. DC-contactor US:

DC-contactor US K1.1 is a special designed contactor with 2x NO contacts for C1 and D1 connection and 1x NC contact for connection of Dynamic Brake resistor RB. The contactor should be controlled by *CurCtrlStat1 (6.03)* bit 10.

The acknowledge can be connected to parameter:

MainContAck (10.21) DCBreakAck (10.23)

If using Dynamic Braking, the drive allows you to select the stopping method under three different situations. Parameters 21.02, 21.03 and 21.04 select the stopping method for loss of the OnOff, run command (StartStop, Jog1, Jog2, etc.), and E-Stop input, respectively. Each can be set to:

• RampStop

•

- TorqueLimit
- CoastStop

• DynBraking

In order to command the drive to perform a DB stop, one or more of these parameters must be set to DynBraking. Most users will want the drive to ramp stop when OnOff or a run command (StartStop, Jog1, Jog2, etc.) input is cleared, and dynamically brake when the E-Stop input is cleared. In that case, use the following settings:

• Off1Mode (21.02)	= RampStop
--------------------	------------

- StopMode (21.03) = RampStop
- E StopMode (21.04) = DynBraking

However, any case is allowed and the final decision is left to the user.

Other parameters control stops during faults. See:

LocalLossCtrl (30.27) ComLossCtrl (30.28) FaultStopMode (30.30) SpeedFbFltMode (30.36)

If using EMF feedback with dynamic braking, set:

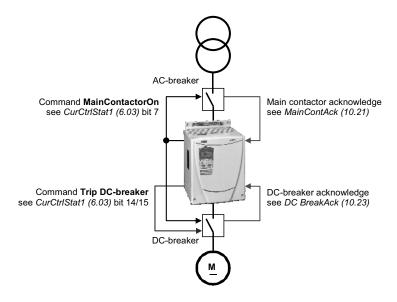

• DynBrakeDly (50.11) = t

Where: t = the time (sec) it normally takes the motor to stop during dynamic braking

#### Attention:

If the motor voltage measurement is connected to the motor terminals (D5 - D7) with modified SDCS-PIN-51) then set: MainContCtrl (21.16) = On

### AC- and DC-breaker controlled by the drive

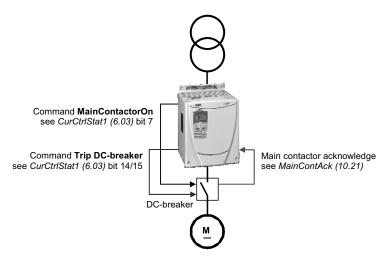

AC- and DC-breaker controlled by the drive

In the above example both, the AC- and the DC-breaker are controlled by the drive. The drive closes and opens both breakers with the command **MainContactorOn**. The result is checked by means of *MainContAck (10.21)* and *DC BreakAck (10.23)*. In case the main contactor acknowledge is missing **F524 MainContAck** [*FaultWord2 (9.02)* bit 7] is set. In case the DC-breaker acknowledge is missing **A103 DC BreakAck** [*AlarmWord1 (9.06)* bit 2] is set, is forced to 150° and single firing pulses are given.

The DC-breaker can be tripped actively by the command **Trip DC-breaker**.

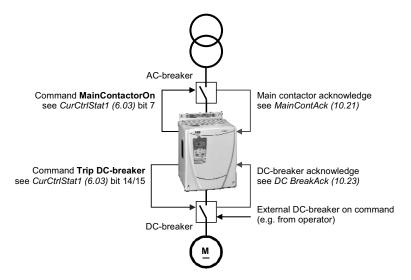

# No AC-breaker, DC-breaker controlled by the drive

No AC-breaker, DC-breaker controlled by the drive

In the above example no AC-breaker is used and the DC-breaker is controlled by the drive. The drive closes and opens the DC-breaker with the command **MainContactorOn**. The result is checked by means of *MainContAck (10.21)*. In case the main contactor acknowledge is missing **F524 MainContAck** [*FaultWord2 (9.02)* bit 7] is set.

The DC-breaker can be tripped actively by the command Trip DC-breaker.

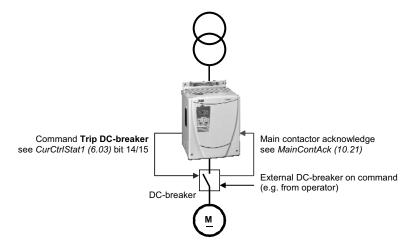

# AC-breaker controlled by the drive, DC-breaker controlled externally

AC-breaker controlled by the drive, DC-breaker controlled externally

In the above example the AC-breaker is controlled by the drive. The drive closes and opens the AC-breaker with the command **MainContactorOn**. The result is checked by means of *MainContAck (10.21)*. In case the main contactor acknowledge is missing **F524 MainContAck** [*FaultWord2 (9.02)* bit 7] is set. The DC-breaker is controlled externally (e.g. by the operator). The result is checked by means of *DC BreakAck (10.23)*. In case the DC-breaker acknowledge is missing **A103 DC BreakAck** [*AlarmWord1 (9.06)* bit 2] is set, is forced to 150° and single firing pulses are given.

The DC-breaker can be tripped actively by the command Trip DC-breaker.

# No AC-breaker, DC-breaker controlled externally

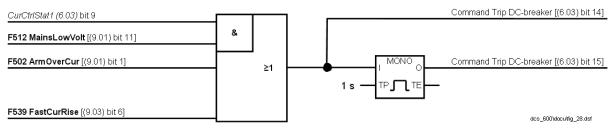

No AC-breaker, DC-breaker controlled externally

In the above example no AC-breaker is used and the DC-breaker is controlled externally (e.g. by the operator). The result is checked by means of *MainContAck* (10.21). In case the main contactor acknowledge is missing **F524 MainContAck** [*FaultWord2 (9.02)* bit 7] is set.

The DC-breaker can be tripped actively by the command Trip DC-breaker.

# **Command Trip DC-breaker**

### Command Trip DC-breaker

The firmware sets the:

- command Trip DC-breaker (continuous signal) [*CurCtrlStat1 (6.03)* bit 14] and
- command Trip DC-breaker (4 s pulse signal) [*CurCtrlStat1 (6.03)* bit 15] by means of
  - F512 MainsLowVolt [FaultWord1 (9.01) bit 11] in regenerative mode,
  - F502 ArmOverCur [FaultWord1 (9.01) bit 1] or

 F539 FastCurRise [FaultWord3 (9.03) bit 6] (see chapter <u>Motor protection</u>) In case a digital output - see group 14 - is assigned to one of the two signals, it is updated immediately after detecting the fault and thus actively tripping the DCbreaker.

# **Dynamic braking**

# General

The drive can be stopped by dynamic braking. The principle is to transfer the power of the machine inertia into a braking resistor. Therefore the armature circuit has to be switched over from the drive to a braking resistor. Additionally flux and field current have to be maintained.

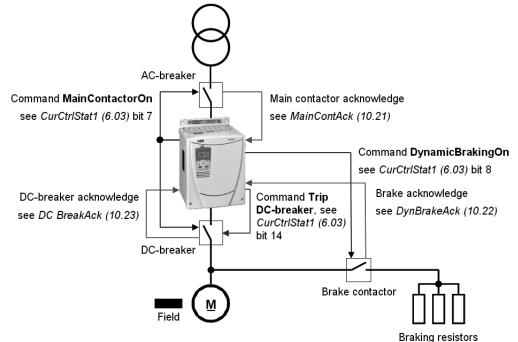

# Operation

Activation

Dynamic braking can be activated by all stop modes, in cases of a fault or due to communication breaks:

- Off1Mode (21.02) when UsedMCW (7.04) bit 0 On is set to low,
- StopMode (21.03) when UsedMCW (7.04) bit 3 Run is set to low,
- E StopMode (21.04) when UsedMCW (7.04) bit 2 Off3N is set to low,
- FaultStopMode (30.30) in case of a trip level 4 fault,
- SpeedFbFltMode (30.36) in case of a trip level 3 fault,
- LocalLossCtrl (30.27) when local control is lost,
- ComLossCtrl (30.28) when communication is lost,
- Ch0 ComLossCtrl (70.05) when communication is lost and
- Ch2 ComLossCtrl (70.15) when communication is lost.

In addition dynamic braking can be forced by setting *AuxCtrlWord (7.02)* bit 5 to high. At the same time *UsedMCW (7.04)* bit 3 **Run** must be set to low.

Application example of dynamic braking

*Function* During dynamic braking the field current is maintained by keeping the field exciter activated. It is recommended to supply external / internal field exciters via a short time UPS to make sure that the field is maintained during mains failure. OnBoard field exciters (D1 to D4) will be supplied via the main contactor, thus

*CurCtrlStat1 (6.03)* bit 7 stays high (**MainContactorOn**) until zero speed is reached.

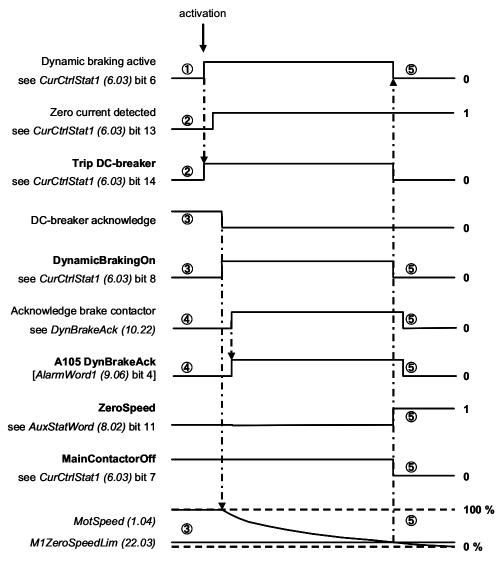

① The activation of dynamic braking immediately sets *CurCtrlStat1 (6.03)* bit 6 to high (dynamic braking active).

② Dynamic braking forces the armature current to zero and opens the DC-breaker by setting *CurCtrlStat1 (6.03)* bit 14 to high (**Trip DC-breaker)**.

③ After the armature current is zero and the DC-breaker acknowledge is gone *CurCtrlStat1 (6.03)* bit 8 is set to high (**DynamicBrakingOn**). This signal is connected to a digital output (see group 14) and used to close the brake contactor. As soon as the brake contactor is closed dynamic braking starts and decreases the speed.

(4) With *DynBrakeAck (10.22)* it is possible to select a digital input for the brake resistor acknowledge. This input sets **A105 DynBrakeAck** [*AlarmWord1 (9.06)* bit 4] as long as the acknowledge is present. Thus the drive cannot be started or restarted while dynamic braking is active, except *FlyStart (21.10)* = **FlyStartDyn**.

Deactivation(5) Dynamic braking is deactivated as soon as zero speed is reached and<br/>AuxStatWord (8.02) bit 11 ZeroSpeed is set to high.<br/>In case of dynamic braking with EMF feedback [M1SpeedFbSel (50.03) = EMF]<br/>there is no valid information about the motor speed and thus no zero speed<br/>information. To prevent an interlocking of the drive after dynamic braking the speed<br/>is assumed zero after DynBrakeDly (50.11) is elapsed:

Dynamic braking sequence

For usage of US style DC-breakers see MainContCtrlMode (21.16).

Firmware description

# **Position counter**

### General

The position counter is used for position measurements. It can be synchronized, that is preset, with an initial value. The counter output value and its initial value are 32-bit signed values. The 32-bit position value is sent to and received as two 16-bit values. Thus the low word dose not possess a sign.

# **Counting procedure**

The position counting is only possible when using an encoder, see *M1SpeedFbSel* (50.03). Its measurement mode is selected by means of *M1EncMeasMode* (50.02) and *PosCountMode* (50.07). Counting is increasing when the motor is rotating forward and decreasing when the motor is rotating backward. A loss free algorithm is used in order to avoid an increasing error due to rounding errors.

# Synchronization

The position counter can be synchronized with an initial value. This initial value is set by means of *PosCountInitLo (50.08)* and *PosCountInitHi (50.09)*. At the synchronization event the position counter output - *PosCountLow (3.07)* and *PosCountHigh (3.08)* - is preset with the initial value and **SyncRdy** [*AuxStatWord (8.02)*, bit 5] is set:

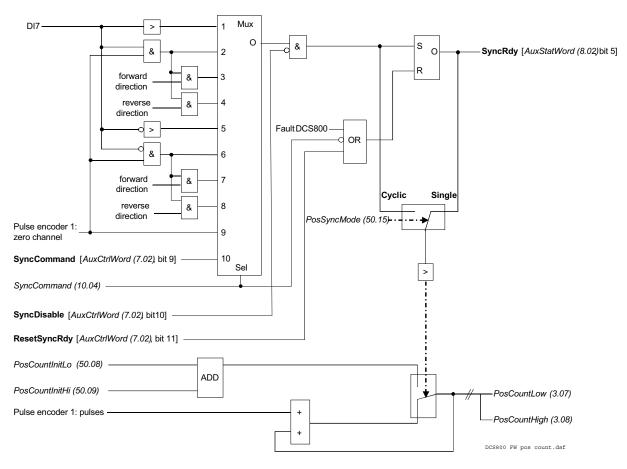

PosCountInitLo (50.08)	⇒	PosCountLow (3.07)
PosCountInitHi (50.09)	⇒	PosCountHigh (3.08)

The synchronization command is chosen by means of *SyncCommand (10.04)*. It can either be **SyncCommand** [*AuxCtrlWord (7.02)*, bit 9] or hardware. The fastest synchronization is achieved by the encoder zero pulse. Synchronization by DI7 is delayed due to its scan time and additional hardware filter times.

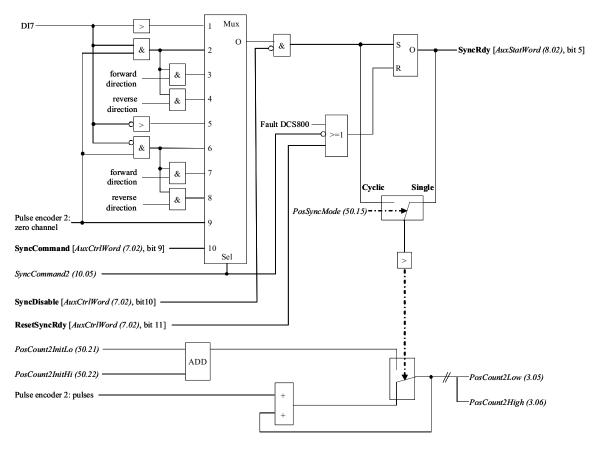

The synchronization can be inhibited by setting **SyncDisable** [*AuxCtrlWord (7.02*), bit 10].

**SyncRdy** [*AuxStatWord (8.02*), bit 5] can be reset by means of **ResetSyncRdy** [*AuxCtrlWord (7.02*), bit 11].

With *PosSyncMode (50.15)* either single or cyclic synchronization is selected. With single synchronization, the next synchronization event must be released with **ResetSyncRdy** [*AuxCtrlWord (7.02*), bit 11].

Pulse encoder 2 position counter logic

# I/O configuration

# **Chapter overview**

This chapter describes the I/O configuration of digital and analog inputs and outputs with different hardware possibilities.

# Digital inputs (DI's)

The basic I/O board is the SDCS-CON-4 with 8 standard DI's. All 8 standard DI's can be replaced with SDCS-IOB-2 and extended by means of one or two RDIO-01 digital I/O extension modules. Thus the maximum number of DI's is 14.

The hardware source is selected by:

- DIO ExtModule1 (98.03) for DI9 to DI11
- DIO ExtModule2 (98.04) for DI12 to DI14 and
- IO BoardConfig (98.15)

### Note:

The maximum amount of digital I/O extension modules is two regardless if an AIMA-01 board is used.

# SDCS-CON-4 / SDCS-IOB-2

On the SDCS-CON-4 the standard DI's are filtered and not isolated. On the SDCS-IOB-2 the standard DI's are filtered and isolated. Selectable hardware filtering time (DI7 and DI8 on the SDCS-IOB-2):

- 2 ms or 10 ms (jumper S7 and S8)

Input voltages:

- 24 VDC to 48 VDC, 115 VAC or 230 VAC depending on the hardware
- for more details see DCS800 Hardware Manual
- Scan time for DI1 to DI6:

– 5 ms

Scan time for DI7 and DI8:

- 3.3 ms / 2.77 ms (synchronized with mains frequency)

# 1<sup>st</sup> and 2<sup>nd</sup> RDIO-01

The extension DI's are isolated and filtered. Selectable hardware filtering time:

- 2 ms or 5 ms to 10 ms

Input voltages:

- 24 VDC to 250 VDC, 110 VAC to 230 VAC
- for more details see RDIO-01 User's Manual

Scan time for DI9 to DI14:

- 5 ms connected at SDCS-CON-4
- 14 ms connected via SDCS-COM-8

### Attention:

To ensure proper connection and communication of the RDIO-01 boards with the SDCS-CON-4 use the screws included in the scope of delivery.

I/O configuration

# Configuration

All DI's can be read from DI StatWord	(8 05)	)-
	(0.00)	· ·

bit	DI	configurable	default setting
0	1	yes	ConvFanAck (10.20)
1	2	yes	MotFanAck (10.06)
2	3	yes	MainContAck (10.21)
3	4	yes	Off2 (10.08)
4	5	yes	E Stop (10.09)
5	6	yes	Reset (10.03)
6	7	yes	OnOff1 (10.15)
7	8	yes	StartStop (10.16)
8	9	yes	-
9	10	yes	-
10	11	yes	-
11	12	no	not selectable
12	13	no	not selectable
13	14	no	not selectable

# Configurable = yes:

The DI's can be connected to several converter functions and it is possible to invert the DI's - *DI1Invert (10.25)* to *DI11Invert (10.35)*. In addition the DI's can be used by Adaptive Program, application program or overriding control.

### Configurable = no:

The DI's can only be used by Adaptive Program, application program or overriding control.

Configurable DI's are defined by means of following parameters:

- Direction (10.02)
- Reset (10.03)
- SyncCommand (10.04)
- MotFanAck (10.06)
- HandAuto (10.07)
- Off2 (10.08)
- E Stop (10.09)
- ParChange (10.10)
- OvrVoltProt (10.13)
- OnOff1 (10.15)
- StartStop (10.16)
- Jog1 (10.17)
- Jog2 (10.18)
- ConvFanAck (10.20)
- MainContAck (10.21)
- DynBrakeAck (10.22)
- DC BreakAck (10.23)

- *Ref1Mux (11.02)*
- Ref2Mux (11.12)
- MotPotUp (11.13)
- MotPotDown (11.14)
- MotPotMin (11.15)
- Ramp2Select (22.11)
- Par2Select (24.29)
- TorqMux (26.05)
- ResCurDetectSel (30.05)
- ExtFaultSel (30.31)
- ExtAlarmSel (30.32)
- M1KlixonSel (31.08)
- M1BrakeAckSel (42.02)
- FldBoostSel (44.17)
- M2KlixonSel (49.38)
- ZeroCurDetect (97.18)
- ResetAhCounter (97.21)

Following restrictions apply:

- The position counter synchronization is fixed assigned to input DI7, if

activated via SyncCommand (10.04)

 DI12 to DI14 are only available in the *DI StatWord (8.05)*, thus they can only be used by Adaptive Program, application program or overriding control

Structure of DI's

# **Digital outputs (DO's)**

The basic I/O board is the SDCS-CON-4 with 7 standard DO's. Standard DO8 is located on the SDCS-PIN-4 for units size D1 - D4 or SDCS-POW-4 for units size D5 - D7. All 8 standard DO's can be replaced with SDCS-IOB-2 and extended by means of one or two RDIO-01 digital I/O extension modules. Thus the maximum number of DO's is 12.

The hardware source is selected by:

- DIO ExtModule1 (98.03) for DO9 and DO10
- DIO ExtModule2 (98.04) for DO11 and DO12
- IO BoardConfig (98.15)

# Note:

The maximum amount of digital I/O extension modules is two regardless if an AIMA-01 board is used.

# SDCS-CON-4 / SDCS-IOB-2

On the SDCS-CON-4 the standard DO's are relay drivers. DO8 is located on the SDCS-PIN-4 and is isolated by means of a relay. If the SDCS-IOB-2 is being used DO6 and DO7 are isolated by means of optocouplers, while the others (DO1 to DO5 and DO8) are isolated by means of relays.

Output values SDCS-CON-4:

- DO1 to DO7 max. 50 mA / 22 VDC at no load
- for more details see *DCS800 Hardware Manual*

Output values SDCS-PIN-4:

- DO8 max. 3 A / 24 VDC, max. 0.3 A / 115 VDC / 230 VDC or max. 3 A / 230 VAC
- for more details see DCS800 Hardware Manual

Output values SCDS-IOB-2:

- DO6 and DO7: max. 50 mA / 24 VDC
- all others: max. 3 A / 24 VDC, max. 0.3 A / 115 VDC / 230 VDC or max. 3 A / 250 VAC
- for more details see DCS800 Hardware Manual

Cycle time for DO1 to DO8:

- 5 ms

# 1<sup>st</sup> and 2<sup>nd</sup> RDIO-01

I/O configuration

The extension DO's are isolated by means of relays. Output values:

- max. 5 A / 24 VDC, max. 0.4 A / 120 VDC or max. 1250 VA / 250 VAC
- for more details see RDIO-01 User's Manual
- Cycle time for DO9 to DO12:
  - 5 ms connected at SDCS-CON-4
  - 14 ms connected via SDCS-COM-8

### Attention:

To ensure proper connection and communication of the RDIO-01 boards with the SDCS-CON-4 use the screws included in the scope of delivery.

# Configuration

bit	DO	configurable	default setting

# All DO's can be read from DO StatWord (8.06):

# Configurable = yes:

The DO's can be connected to any integer or signed integer of the drive by means of group 14. It is possible to invert the DO's by simply negate *DO1Index (14.01)* to *DO8Index (14.15)*. In addition the DO's can be used by Adaptive Program, application program or overriding control if the corresponding *DOxIndex (14.xx)* is set to zero - see *DO CtrlWord (7.05)*.

### Configurable = no:

The DO's can only be used by Adaptive Program, application program or overriding control - see DO CtrlWord (7.05).

# Note:

DO8 is only available as relay output on the SDCS-PIN-4, if no SDCS-IOB-2 is used.

Structure of DO's

# Analog inputs (Al's)

The basic I/O board is the SDCS-CON-4 with 4 standard AI's. All 4 standard AI's can be replaced with SDCS-IOB-3 and extended by means of one or two RAIO-01 analog I/O extension modules. Thus the maximum number of AI's is 8.

The hardware source is selected by:

- AIO ExtModule (98.06) for AI5 and AI6
- AIO MotTempMeas (98.12) for AI7 and AI8
- IO BoardConfig (98.15)

# Note:

The maximum amount of analog I/O extension modules is two regardless if an AIMA-01 board is used.

# SDCS-CON-4

Hardware setting:

- switching from voltage input to current input by means of jumper S2 and S3
- for more details see DCS800 Hardware Manual

Input range AI1 and AI2 set by parameter:

-  $\pm 10$  V, 0 V to 10 V, 2 V to 10 V, 5 V offset, 6 V offset

 $-\pm$  20 mA, 0 mA to 20 mA, 4 mA to 20 mA, 10 mA offset, 12 mA offset Input range AI3 and AI4 set by parameter:

- $\pm 10$  V, 0 V to 10 V, 2 V to 10 V, 5 V offset, 6 V offset
- **Resolution:** 
  - 15 bits + sign

Scan time for Al1 and Al2:

- 3.3 ms / 2.77 ms (synchronized with mains frequency)
- Scan time for AI3 and AI4:
  - 5 ms

Additional functions:

 motor temperature measurement for a PTC connected to Al2 - see section <u>Motor protection</u>

# SDCS-IOB-3

Hardware setting:

- switching from voltage input to current input by means of jumper S1
- the hardware gain for Al2 and Al3 can be increased by 10 with jumpers S2 and S3, thus the input range changes e.g. from  $\pm 10$  V to  $\pm 1$  V
- for more details see DCS800 Hardware Manual

Input range AI1 to AI4 set by parameter:

-  $\pm 10$  V, 0 V to 10 V, 2 V to 10 V, 5 V offset, 6 V offset

- $-\pm$  20 mA, 0 mA to 20 mA, 4 mA to 20 mA, 10 mA offset, 12 mA offset Resolution:
  - 15 bits + sign

Scan time for AI1 and AI2:

- 3.3 ms / 2.77 ms (synchronized with mains frequency)
- Scan time for AI3 and AI4:

- 5 ms

I/O configuration

Additional functions:

- motor temperature measurement for PT100 or PTC connected to Al2 and Al3 - see section <u>Motor protection</u>
- residual current detection monitor input via AI4 see section <u>Motor</u> <u>protection</u>

# 1<sup>st</sup> RAIO-01

Hardware setting:

- input range and switching from voltage to current by means of a DIP switch,
- for more details see RAIO-01 User's Manual

Input range AI5 and AI6 set by parameter:

- ±10 V, 0 V to 10 V, 2 V to 10 V, 5 V offset, 6 V offset
- $\pm 20$  mA, 0 mA to 20 mA, 4 mA to 20 mA, 10 mA offset, 12 mA offset Resolution:
  - 11 bits + sign

Scan time for AI5 and AI6:

- 10 ms connected at SDCS-CON-4
- 14 ms connected via SDCS-COM-8

Additional functions:

- all AI's are galvanically isolated

### Attention:

To ensure proper connection and communication of the RAIO-01 board with the SDCS-CON-4 use the screws included in the scope of delivery.

# 2<sup>nd</sup> RAIO-01

Hardware setting:

- AI7 and AI8 are only used for motor temperature measurement, thus set 0
   V to 2 V for 1 PT100 respectively 0 V to 10 V for 2 or 3 PT100 using the DIP switch
- for more details see RAIO-01 User's Manual

**Resolution:** 

11 bits + sign

Scan time for AI7 and AI8:

- 10 ms connected at SDCS-CON-4
- 14 ms connected via SDCS-COM-8
- Additional functions:
  - all Al's are galvanically isolated
  - motor temperature measurement for PT100 connected to AI7 and AI8 see section <u>Motor protection</u>,

### Attention:

To ensure proper connection and communication of the RAIO-01 board with the SDCS-CON-4 use the screws included in the scope of delivery.

# Configuration

The value of Al1 to Al6 and AlTacho can be read from group 5.

AI	configurable	default setting
1	yes	-
2	yes	-
3	yes	-
4	yes	-
5	yes	-
6	yes	-
7	temperature	-
8	temperature	-

# Configurable = yes:

The Al's can be connected to several converter functions and it is possible to scale them by means of group 13. In addition the Al's can be read by Adaptive Program, application program or overriding control.

# Configurable = temperature:

The Al's can only be used by the motor temperature measurement - see *M1TempSel (31.05)* and *M2TempSel (49.35)*.

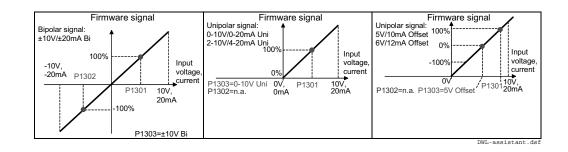

Configurable Al's are defined by means of following parameters:

- Ref1Sel (11.03)
- Ref2Sel (11.06)
- TorqUsedMaxSel (20.18)
- TorqUsedMinSel (20.19)
- TorqRefA Sel (25.10)
- TorgCorrect (26.15)
- ResCurDetectSel (30.05)
- M1TempSel (31.05)
- M1StrtTorqRefSel (42.07)
- CurSel (43.02)
- M2TempSel (49.35)
- M2StrtTorqRefSel (49.44)

Following restrictions apply:

- the residual current detection input is fixed assigned to AI4, if activated via *ResCurDetectSel (30.05)*
- the motor temperature measurement is fixed assigned to Al2 and Al3 respectively Al7 and Al8, if activated via *M1TempSel (31.05)* respectively *M2TempSel (49.35)*

# Scaling

I/O configuration

It is possible to scale Al1 to Al6 with 3 parameters each:

- the range of each AI is set by means of a jumper distinguishing between current and voltage and *ConvModeAI1 (13.03)* to *ConvModeAI6 (13.27)*
- +100 % of the input signal connected to an AI is scaled by means of AI1HighVal (13.01) to AI6HighVal (13.25)
- -100 % of the input signal connected to an AI is scaled by means of AI1LowVal (13.02) to AI6LowVal (13.26) Example:

In case the min. / max. voltage (±10 V) of AI1 should equal ±250 % of *TorgRefExt (2.24)*, set:

Structure of AIs.dsf

TorqRefA Sel (25.10) = Al1 ConvModeAl1 (13.03) =  $\pm$ 10V Bi Al1HighVal (13.01) = 4000 mV Al1LowVal (13.02) = -4000 mV

X1:4 AIO MotTempMeas (98.12)

Structure of Al's

# Analog outputs (AO's)

The basic I/O board is the SDCS-CON-4 with 3 standard AO's. Two AO's are programmable, the third one is fixed and used to display the actual armature current taken directly from the burden resistors. All 3 standard AO's can be replaced with SDCS-IOB-3 and extended by means of one or two RAIO-01 analog I/O extension modules. Thus the maximum number of AO's is 7.

The hardware source is selected by:

- AIO ExtModule (98.06) for AO3 and AO4
- AIO MotTempMeas (98.12) for AO5 and AO6
- IO BoardConfig (98.15)

### Note:

The maximum amount of analog I/O extension modules is two regardless if an AIMA-01 board is used.

# SDCS-CON-4 / SDCS-IOB-3

Output range AO1 and AO2 set by parameter:

-  $\pm 10$  V, 0 V to 10 V, 2 V to 10 V, 5 V offset, 6 V offset

Output range fixed AO I-act:

- 8 V equals the minimum of 325 % M1NomCur (99.03) or 230 % ConvNomCur (4.05)
- see also lactScaling (4.26)
- for more details see DCS800 Hardware Manual

Resolution:

- 11 bits + sign

Cycle time for AO1 and AO2:

– 5 ms

Cycle time fixed AO I-act:

directly taken from hardware

Additional functions:

 the gain of the fixed AO I-act can be adjusted by means of R110 on the SDCS-IOB-3

# 1<sup>st</sup> RAIO-01

Output range AO3 and AO4 set by parameter:

- 0 mA to 20 mA, 4 mA to 20 mA, 10 mA offset, 12 mA offset

Resolution:

– 12 bits

Cycle time for AO3 and AO4:

- 5 ms connected at SDCS-CON-4
- 14 ms connected via SDCS-COM-8
- Additional functions:
  - all AO's are galvanically isolated

### Attention:

To ensure proper connection and communication of the RAIO-01 board with the SDCS-CON-4 use the screws included in the scope of delivery.

# 2<sup>nd</sup> RAIO-01

Hardware settings:

- AO5 and AO6 are only used for motor temperature measurement, no additional setting needed
- for more details see RAIO-01 User's Manual

Resolution:

12 bits

Cycle time for AO5 and AO6:

- 5 ms connected at SDCS-CON-4
- 14 ms connected via SDCS-COM-8

Additional functions:

- all AO's are galvanically isolated
- motor temperature measurement for PT100 connected to AO5 and AO6 see section <u>Motor protection</u>

# Attention:

To ensure proper connection and communication of the RAIO-01 board with the SDCS-CON-4 use the screws included in the scope of delivery.

# Configuration

The value of AO1 and AO2 can be read from group 5.

AO	configurable	default setting
1	yes	-
2	yes	-
3	yes	-
4	yes	-
5	temperature	-
6	temperature	-
Curr	fixed	not selectable

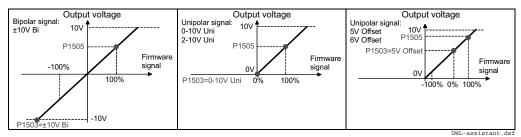

Configurable = yes:

The AO's can be connected to any integer or signed integer of the drive by means of group 15. It is possible to invert the AO's by simply negate *IndexAO1 (15.01)* to *IndexAO4 (15.16)*. In addition the AO's can be used by Adaptive Program, application program or overriding control if the corresponding *IndexAOx (15.xx)* is set to zero - see *CtrlWordAO1 (15.02)* to *CtrlWordAO4 (15.17)*.

Configurable = temperature:

The AO's can only be used by the motor temperature measurement - see *M1TempSel (31.05)* and *M2TempSel (49.35)*.

# Scaling

It is possible to scale AO1 to AO4 with 2 parameters each:

- the range of each AO is set by means of ConvModeAO1 (15.03) to ConvModeAO4 (15.18)
- if the range is set to bipolar or unipolar signals with offset, ±100 % of the input signal connected to an AO is scaled by means of *ScaleAO1 (15.06)* to *ScaleAO4 (15.20)*
- If the range is set to unipolar signals without offset, only +100 % of the input signal connected to an AO is scaled by means of *ScaleAO1 (15.06)* to *ScaleAO4 (15.20)*. The smallest value is always zero.
- It is possible to invert the AO's by simply negate IndexAO1 (15.01) to IndexAO4 (15.16)

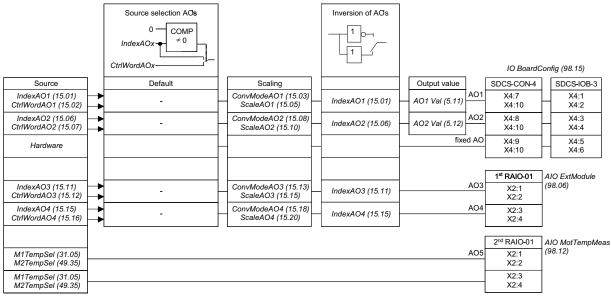

Example:

In case the min. / max. voltage ( $\pm$ 10 V) of AO1 should equal  $\pm$ 250 % of *TorqRefUsed (2.13)*, set:

IndexAO1 (15.01) = 213

*ConvModeAO1 (15.03)* = ±10V Bi

ScaleAO1 (15.05) = 4000 mV

Structure of AO's

# Communication

# **Chapter overview**

This chapter describes the communication capabilities of the drive.

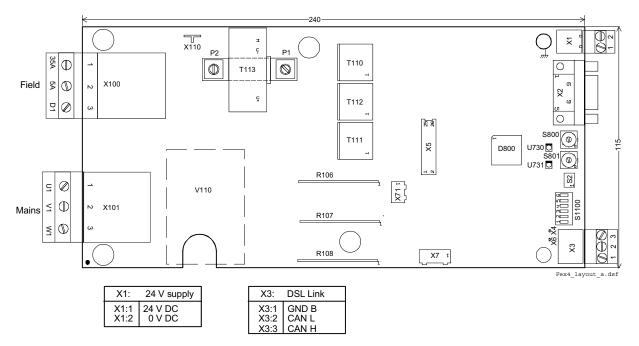

# **DCSLink with SDCS-DSL-4**

# General

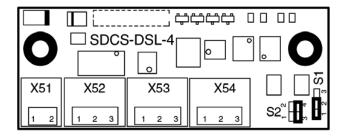

The DCSLink is a multi-purpose twisted pair bus for the DCS800. All functions using the same hardware and can be used at the same time. The DCSLink can be used for excitation, master-follower, drive-to-drive communication and 12-pulse.

# **Excitation, commissioning a FEX-4**

# Layout FEX-4

# Layout SDCS-DSL-4

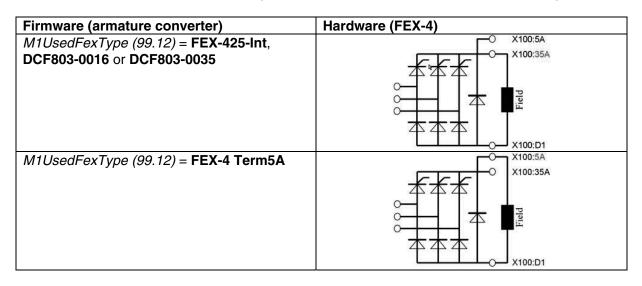

Communication

# Set the FEX-4 type

The FEX-4 can be used in 4 different applications:

- FEX-425-Int (as internal field exciter of a D5 module with up to 25 A)
- **DCF803-0016** (as external field exciter with up to 16 A)
- DCF803-0035 (as external field exciter with up to 35 A) and
- FEX-4 Term5A (as internal or external field exciter with max. 5 A)

# Set the node numbers, transmission speed and the communication supervision

In all bus systems unique node ID numbers are required and have to be set in the armature converter and the FEX-4. Two stations with the same node ID number are not allowed.

For example set the armature converter node ID number to 1 and the FEX-4 node ID number to 13.

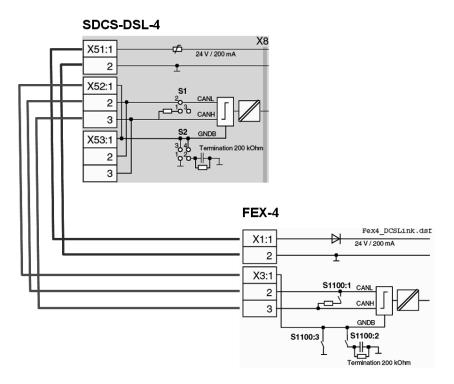

The communication supervision is activated in the armature converter. Also the transmission speed of all converters has to match:

Firmware (armature converter)	r) Hardware (FEX-4)					
DCSLinkNodeID (94.01) = 1	-					
BaudRate (94.02) = 500 kBit/s	S1100:4	S1100:5	S1100:6	kBit/s		
	OFF	OFF	ON	500		
<i>FexTimeOut (94.07)</i> = 100 ms	-					
M1FexNode (94.08) = 13	S801 1		S800			
			3			
	S801		S800	a g g		

Communication

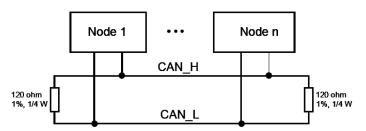

# Set the DCSLink

Cable connection:

Bus- and ground termination:

The DCSLink is a bus system using twisted pair cables. Therefore bus termination is mandatory at the two physical ends of the bus.

Hardware (SDCS-DSL-4)	Hardware (FEX-4)
jumper <b>S1</b> = <b>1-2</b> if bus termination is needed	jumper <b>S1100:1</b> = <b>ON</b> if bus termination is needed
jumper <b>S2</b> sets the ground termination	jumper <b>S1100:2</b> and <b>S1100:3</b> set the ground termination

Set the supply of the FEX-4 The FEX-4 can be either supplied by 1-phase or by 3-phases:

Firmware (armature converter)	Hardware (FEX-4)
M1OperModeFex4 (45.22) = <b>3-phase</b>	O X100:5A
	X101:W1 Z
	本本本
M1OperModeFex4 (45.22) = 1-phase	C X100:5A
	444
	X101:U1 X101:V1
	X101:W1 O
	本本本

# **Checking the FEX-4**

There are several signals to check the FEX-4 installation:

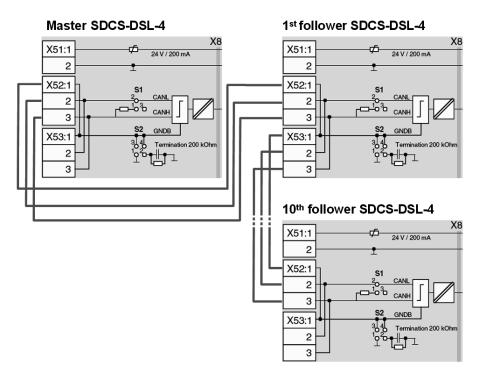

Firmware (armature c	onverter)	Hardware (FEX-4)	
Mot1FexType (4.06)	shows the FEX-4 type as chosen with <i>M1UsedFexType</i> (99.12)	yellow (U731) or green (U730) LED is blinking:	waiting for DCSLink communication
DCSLinkStat1 (4.18) or DCSLinkStat2 (4.19)	show the status of the field exciter node as chosen with <i>M1FexNode (94.08)</i>	yellow (U731) or green (U730) LED is steady:	DCSLink communication is OK

For further information consult the DCS800 Hardware Manual.

# Master-follower, commissioning

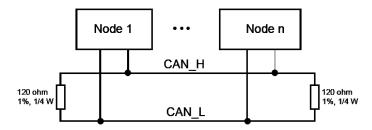

# Set the DCSLink hardware

Cable connection:

Bus- and ground termination:

The DCSLink is a bus system using twisted pair cables. Therefore bus termination is mandatory at the two physical ends of the bus.

In the above example termination is mandatory at the master and the 10<sup>th</sup> follower.

SDCS-DSL-4
jumper <b>S1</b> = <b>1-2</b> sets the bus termination
jumper <b>S2</b> sets the ground termination

98

### Set the node ID numbers and transmission speed

In all bus systems unique node ID numbers are required and have to be set in the master and all followers. Two stations with the same node ID number are not allowed.

For example set the masters node ID number to 1 and add one for each follower. Also the transmission speed of all converters has to match:

Firmware master	Firmware first follower	Firmware 10 <sup>th</sup> follower
DCSLinkNodeID (94.01) = 1	DCSLinkNodeID (94.01) = 2	DCSLinkNodeID (94.01) = 11
BaudRate (94.02) = <b>500kBit/s</b>	BaudRate (94.02) = 500kBit/s	BaudRate (94.02) = <b>500kBit/s</b>

# Activate the mailboxes

The master-follower communication utilizes 4 mailboxes for data transfer. Thus data transfer to any device / node in the system is possible.

Positive mailbox node ID numbers only transmit data, negative only receive data. To get communication mailbox node ID pairs (e.g. 5 and -5) are needed:

Firmware master	Firmware first follower	Firmware 10 <sup>th</sup> follower
MailBox1 (94.12) = 5	MailBox1 (94.12) = -5	MailBox1 (94.12) = -5

# Attention:

Positive mailbox node ID numbers must be unique. Negative mailbox node ID numbers can be used by several mailboxes.

The master mailbox one for example is set to 5 and thus transmitting data. Mailbox one of the followers is set to -5 and thus receiving data.

# Activate the communication supervision

The communication supervision is activated by means of *MailBoxCycle1 (94.13)*. The function of *MailBoxCycle1 (94.13)* is depending on the setting of *MailBox1 (94.12)*.

If MailBox1 (94.12) is positive:

- data will be transmitted.
- MailBoxCycle1 (94.13) sets the transmitting and receiving intervals.
- if MailBoxCycle1 (94.13) is set to 3 ms the transmit and receiving intervals are synchronized with mains frequency, either 3.3 ms or 2.77 ms.
- values from 1 2 ms are too fast and will generate a fault.

- the communication is inactive, if *MailBoxCycle1 (94.13)* is set to 0 ms. If MailBox1 (94.12) is negative:

- data will be received.
- MailBoxCycle1 (94.13) sets the communication timeout. This is the time delay before a drive-to-drive or master-follower communication break is declared. Depending on the setting of ComLossCtrl (30.28) either F544
   P2PandMFCom [FaultWord3 (9.03) bit 11] or A112 P2PandMFCom [AlarmWord1 (9.06) bit 11] is set.
- the communication fault and alarm are inactive, if *MailBoxCycle1 (94.13)* is set to 0 ms.

### Attention:

The communication timeout has to be set at least twice as long as the corresponding mail box cycle time parameter:

Communication

Firmware master	Firmware first follower	Firmware 10 <sup>th</sup> follower
MailBoxCycle1 (94.13) = 100	MailBoxCycle1 (94.13) = 200	MailBoxCycle1 (94.13) = 200

# Send and receive values

Each mailbox can transmit / receive up to 4 values depending on the sign of the mailbox node ID number. The master-follower communication usually needs to send 3 values from the master to the followers, thus the follower is completely controlled by the master:

# Master parameters (source)

<i>TrmtRecVal1.1 (94.14)</i> = <b>701</b> or <b>704</b>	MainCtrlWord (7.01) or UsedMCW (7.04)
TrmtRecVal1.2 (94.15) = <b>217</b>	SpeedRefUsed (2.17)
<i>TrmtRecVal1.3 (94.16)</i> = <b>210</b>	TorqRef3 (2.10)
<i>TrmtRecVal1.4 (94.17)</i> = 0	not used

#### Follower parameters (sinks)

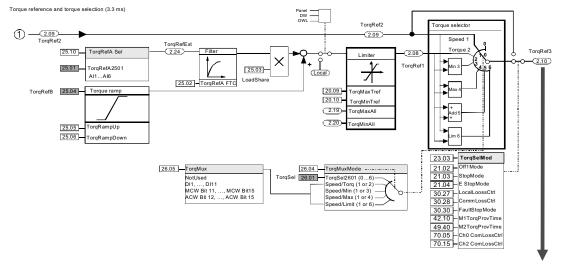

<i>TrmtRecVal1.1 (94.14)</i> = <b>701</b>	MainCtrlWord (7.01)
<i>TrmtRecVal1.2 (94.15)</i> = <b>2301</b>	SpeedRef (23.01)
<i>TrmtRecVal1.3 (94.16)</i> = <b>2501</b>	TorqRefA (25.01)
<i>TrmtRecVal1.4 (94.17)</i> = 0	not used
CommandSel (10.01) = MainCtrlWord	
<i>TorqSel (26.01)</i> = <b>Torque</b> or <b>Add</b>	

Master signal *TorqRef3 (2.10)* is send via master parameter *TrmtRecVal1.3 (94.16)* to follower signal *TorqRefA (25.01)* via follower parameter *TrmtRecVal1.3 (94.16)*.

# **Firmware structure**

#### Master:

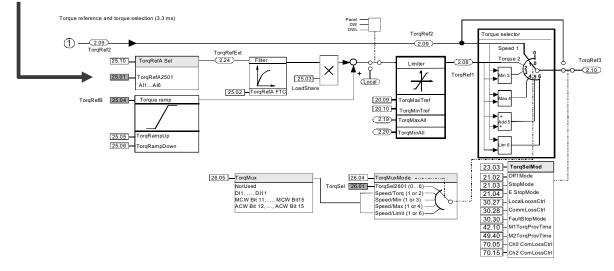

Master parameter *TrmtRecVal1.3 (94.16)* = 210 sends the torque value to the follower

# Follower:

MailBox1 (94.12) = -5, configures followers first mailbox to receive data

Follower parameter TrmtRecVal1.3 (94.16) = 2501 gets the torque value from the master

For further information consult the DCS800 Hardware Manual.

# Additional settings

# Field weakening:

In case of field weakening all followers must have a speed feedback via encoder, tacho or *MotSpeed (1.04)* - see *M1SpeedFbSel (50.03)* = **External**. **Note:** 

When connecting the output of one encoder to two drives a splitter has to be used.

# Connection to overriding control:

In case followers are connected to an overriding control make sure, that the overriding control is not writing on the same signals (via group 51 and / or group 90) as the master (via the master-follower link). There is always a problem when two sources writing on one sink. Be very carefully with e.g. *MainCtrlWord* (7.01), *SpeedRef* (23.01), *TorqRefA* (25.01), ...

# E-stop:

In case of an E-stop the master must be in control of all followers. Thus set:

- *E Stop (10.09)* = **NotUsed** and
- TorqSelMod (26.03) = Fix

in all followers.

# Feedback from the followers to the master:

The feedback from the followers to the master has to be set up manually using drive-to-drive communication and Adaptive Program or application program.

# **Drive-to-drive communication**

# Set the DCSLink hardware

Cable connection:

1st drive SDCS-DSL-4 X8 X51:1 ₫ 24 V / 200 mA 2 X52:1 **S**1 2  $-10^{3}0$ CANH З **S**2 X53:1 n 200 kOh 2 Т з 2<sup>nd</sup> drive SDCS-DSL-4 X8 X51:1 ₫ 24 V / 200 mA 2 X52:1 **S1** 2 ----<sup>1</sup>0<sup>3</sup>0 3 S2

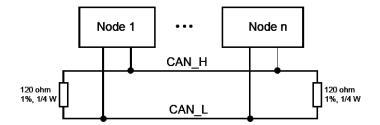

Bus- and ground termination:

X53:1

2

3

The DCSLink is a bus system using twisted pair cables. Therefore bus termination is mandatory at the two physical ends of the bus.

nation 200 kOł

t†\_

In the above example termination is mandatory at drive 1 and drive 2.

SDCS-DSL-4
jumper <b>S1</b> = <b>1-2</b> sets the bus termination
jumper <b>S2</b> sets the ground termination

Communication

# Set the node ID numbers and transmission speed

In all bus systems unique node ID numbers are required and have to be set in the master and all followers. Two stations with the same node ID number are not allowed.

For example set the  $1^{st}$  drives node ID number to 1 and the  $2^{nd}$  drives node ID number to 2.

Also the transmission speed of all converters has to match:

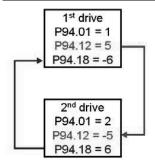

Firmware 1 <sup>st</sup> drive	Firmware 2 <sup>nd</sup> drive
DCSLinkNodeID (94.01) = 1	DCSLinkNodeID (94.01) = 2
BaudRate (94.02) = <b>500kBit/s</b>	BaudRate (94.02) = <b>500kBit/s</b>

# Activate the mailboxes

The drive-to-drive communication utilizes 4 mailboxes for data transfer. Thus data transfer to any device / node in the system is possible.

Positive mailbox node ID numbers only transmit data, negative only receive data. To get communication mailbox node ID pairs (e.g. 5 / -5 and 6 / -6) are needed:

Firmware 1 <sup>st</sup> drive	Firmware 2 <sup>nd</sup> drive
MailBox1 (94.12) = 5	MailBox1 (94.12) = -5
<i>MailBox2 (94.18)</i> = -6	<i>MailBox2 (94.18)</i> = 6

### Attention:

Positive mailbox node ID numbers must be unique. Negative mailbox node ID numbers can be used by several mailboxes.

# Activate the communication supervision

The communication supervision is activated by means of *MailBoxCycle1 (94.13)*. The function of *MailBoxCycle1 (94.13)* is depending on the setting of *MailBox1 (94.12)*.

If MailBox1 (94.12) is positive:

- data will be transmitted.
- *MailBoxCycle1 (94.13)* sets the transmitting and receiving intervals.
- if *MailBoxCycle1 (94.13)* is set to 3 ms the transmit and receiving intervals are synchronized with mains frequency, either 3.3 ms or 2.77 ms.
- values from 1 2 ms are too fast and will generate a fault.
- the communication is inactive, if *MailBoxCycle1 (94.13)* is set to 0 ms.
- If MailBox1 (94.12) is negative:
  - data will be received.

- MailBoxCycle1 (94.13) sets the communication timeout. This is the time delay before a drive-to-drive or master-follower communication break is declared. Depending on the setting of ComLossCtrl (30.28) either F544
   P2PandMFCom [FaultWord3 (9.03) bit 11] or A112 P2PandMFCom [AlarmWord1 (9.06) bit 11] is set.
- the communication fault and alarm are inactive, if *MailBoxCycle1 (94.13)* is set to 0 ms.

### Attention:

The communication timeout has to be set at least twice as long as the corresponding mail box cycle time parameter:

Firmware 1 <sup>st</sup> drive	Firmware 2 <sup>nd</sup> drive
MailBoxCycle1 (94.13) = 100	MailBoxCycle1 (94.13) = 200
MailBoxCycle2 (94.19) = 200	<i>MailBoxCycle2 (94.19)</i> = 100

# Send and receive values

Each mailbox can transmit / receive up to 4 values depending on the sign of the mailbox node ID number.

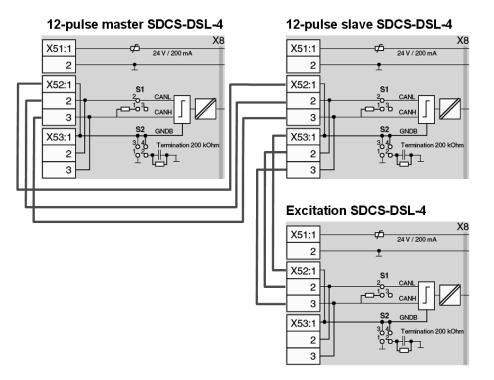

1 <sup>st</sup> mailbox	
TrmtRecVal1.1 (94.14)	
TrmtRecVal1.2 (94.15)	
TrmtRecVal1.3 (94.16)	
TrmtRecVal1.4 (94.17)	

2 <sup>nd</sup> mailbox
TrmtRecVal2.1 (94.20)
TrmtRecVal2.2 (94.21)
TrmtRecVal2.3 (94.22)
TrmtRecVal2.4 (94.23)

# 12-pulse

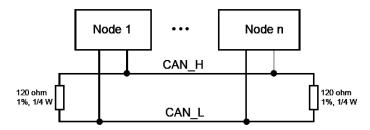

# Set the DCSLink hardware

Cable connection:

Bus- and ground termination:

The DCSLink is a bus system using twisted pair cables. Therefore bus termination is mandatory at the two physical ends of the bus.

In the above example termination is mandatory at the 12-pulse master and the excitation.

SDCS-DSL-4	
jumper <b>S1</b> = <b>1-2</b> sets the bus termination	
jumper <b>S2</b> sets the ground termination	

106

### Set the node numbers, transmission speed and the communication supervision

In all bus systems unique node ID numbers are required and have to be set in the 12-pulse master, 12-pulse slave and the excitation. Two stations with the same node ID number are not allowed.

For example set the 12-pulse master node ID number to 1, the 12-pulse slave node ID number to 31 and the excitation node ID number to 21.

The 12-pulse and excitation communication supervision is activated in the 12-pulse master.

Also the transmission speed of all converters has to match:

Firmware 12-pulse master	Firmware 12-pulse slave	Firmware excitation
DCSLinkNodeID (94.01) = 1	DCSLinkNodeID (94.01) = 31	DCSLinkNodeID (94.01) = 21
BaudRate (94.02) = 500kBit/s	BaudRate (94.02) = 500kBit/s	BaudRate (94.02) = 500kBit/s
12P TimeOut (94.03) = 100	-	-
ms		
<i>12P SlaNode (94.04)</i> = 31	-	-
<i>FexTimeOut (94.07)</i> = 100 ms	-	-
<i>M1FexNode (94.08)</i> = 21	-	-

# DDCS channels with SDCS-COM-8

# General

The following table describes the usage of the DDCS channels of the SDCS-COM-8 board.

Channel	Standard usage	SDCS-COM-81	SDCS-COM-82
Ch0	Overriding control or NETA-01	10 Mb (e.g. FCI,	5 Mb (fieldbus
	connection	AC 800M)	adapter)
Ch1	I/O extensions via AIMA board	5 Mb	5 Mb
Ch2	Master-follower link	10 Mb	10 Mb
Ch3	DriveWindow or NETA-01 connection	10 Mb	10 Mb

The communication protocol of Ch0 to Ch3 is DDCS (Distributed Drives Communication System). The Ch0 of the SDCS-COM-8 supports either DDCS or DriveBus, see *Ch0 DriveBus (71.01)*. Both, the DDCS and DriveBus link between the overriding control and the drive, using data sets for information exchange. Each data set is a package of three words (signals or parameters). If a data set is received by the drive the corresponding data set is automatically transmitted to the overriding control as response:

Drive Received data		Transmitted data
	$\rightarrow \rightarrow \rightarrow$ data set 10	data set 11 $\rightarrow \rightarrow \rightarrow$
	$\rightarrow \rightarrow \rightarrow$ data set 12	data set 13 $\rightarrow \rightarrow \rightarrow$

The data received from the overriding control affects only the RAM (not FPROM) memory in the drive.

# Integer scaling on the DDCS link

Communication between the drive and the overriding control uses 16 bit integer values. The overriding control has to use the information given in integer scaling to be able to change values of parameters properly.

Example1:

If *TorqMaxSPC (20.07)* is written to from the overriding control an integer value of 100 corresponds to 1 % torque.

Example2:

If *SpeedRef (23.01)* is written to from the overriding control 20.000 equals the speed (in rpm) shown in *SpeedScaleAct (2.29)*.

1.08	MotTorq (motor torque)
	Motor torque in percent of <i>MotNomTorque (4.23)</i> :
	<ul> <li>Filtered by means of a 6<sup>th</sup> order FIR filter (sliding average filter), filter time is 1 mains voltage period.</li> </ul>
	Int. Scaling: 100 == 1 % Type: SI Volatile: Y

# Ch0 communication to overriding control

#### **ABB** overriding control

The communication between the overriding control and the SDCS-COM-8 via Ch0 uses data sets. The data sets are connected to the firmware by read- and write pointers - see sections <u>Received data set table</u> and <u>Transmitted data set table</u>. Received and transmitted values are set according to groups 90 to 93. Received data sets are typically connected to <u>MainCtrlWord (7.01)</u> and <u>SpeedRef (23.01)</u>, whereas transmitted data sets are connected to <u>MainStatWord (8.01)</u> and <u>MotSpeed (1.04)</u>.

#### Parameter setting example

The following table lists the parameters which need to be defined when setting up the communication between the drive and ABB overriding control.

Drive parameters	Settings	Comments
CommandSel (10.01)	MainCtrlWord	
Ref1Sel (11.03)	SpeedRef2301	
Ch0 NodeAddr (70.01)	0 - 254	Ch0 node address
Ch0 LinkControl (70.02)	10	Ch0 LED light intensity
Ch0 BaudRate (70.03)	4 Mbits/s	for ABB overriding control
Ch0 TimeOut (70.04)	100	Time delay for communication
		loss detection
Ch0 ComLossCtrl (70.05)	RampStop	Reaction to communication
		loss detection
Ch0 HW Config (70.06)	Ring or Star	Ch0 topology selection
CH0 DsetBaseAddr (70.24)	10	use either data set range 1 to
		16 or data set range 10 to 25
CommModule (98.02)	COM-8/AC800x	
Ch0 DriveBus (71.01)	No or Yes	Ch0 communication mode
		selection

DCS800 parameter setting for ABB overriding control

#### Note:

 $\pm$  20.000 speed units (decimal) for speed reference [*SpeedRef* (23.01)] and speed actual [*MotSpeed* (1.04)] corresponds to the speed shown in *SpeedScaleAct* (2.29). That speed is set by means of *M1SpeedScale* (50.01) respectively *M1SpeedMin* (20.01) or *M1SpeedMax* (20.02).

#### **Received data set table**

Send from the overriding control to the drive (typical).

Addresses	Addresses for data received from the overriding control					
Data set	Data set	Update	COM-8	Selection	Default	Parameter name
number	index	time	$\Rightarrow$ CON-4	parameter	value	(default values)
	1	2 ms	1 ms	(90.01)	701	MainCtrlWord
(70.24) + 0	2	2 ms	1 ms	(90.02)	2301	SpeedRef
	3	2 ms	1 ms	(90.03)	2501	TorqRefA
	1	2 ms	1 ms	(90.04)	702	AuxCtrlWord
(70.24) + 2	2	2 ms	1 ms	(90.05)	703	AuxCtrlWord2
	3	2 ms	1 ms	(90.06)		
	1	2 ms	1 ms	(90.07)		
(70.24) + 4	2	2 ms	1 ms	(90.08)		
	3	2 ms	1 ms	(90.09)		
	1	2 ms	1 ms	(90.10)		
<i>(70.24)</i> + 6	2	2 ms	1 ms	(90.11)		
	3	2 ms	1 ms	(90.12)		
	1	10 ms	20 ms	(90.13)		
(70.24) + 8	2	10 ms	20 ms	(90.14)		
	3	10 ms	20 ms	(90.15)		
	1	10 ms	20 ms	(90.16)		
<i>(70.24)</i> + 10	2	10 ms	20 ms	(90.17)		
	3	10 ms	20 ms	(90.18)		
	1	10 ms	20 ms	(91.01)		
<i>(70.24)</i> + 12	2	10 ms	20 ms	(91.02)		
	3	10 ms	20 ms	(91.03)		
	1	10 ms	20 ms	(91.04)		
<i>(70.24)</i> + 14	2	10 ms	20 ms	(91.05)		
	3	10 ms	20 ms	(91.06)		

#### Note:

The update time is the time within the drive is reading values from the data sets. Since the drive is a communication slave, the actual cycle time depends on the cycle time of the communication master.

110

#### Transmitted data set table

Send from the drive to the overriding control (typical).

Addresses	Addresses for data transmitted to the overriding control					
Data set	Data set	Update	CON-4	Selection	Default	Parameter name
number	index	time	⇒ COM-8	parameter	value	(default values)
	1	2 ms	1 ms	(92.01)	801	MainStatWord
<i>(70.24)</i> + 1	2	2 ms	1 ms	(92.02)	104	MotSpeed
	3	2 ms	1 ms	(92.03)	209	TorqRef2
	1	2 ms	1 ms	(92.04)	802	AuxStatWord
(70.24) + 3	2	2 ms	1 ms	(92.05)	101	MotSpeedFilt
	3	2 ms	1 ms	(92.06)	108	MotTorq
	1	2 ms	1 ms	(92.07)	901	FaulWord1
(70.24) + 5	2	2 ms	1 ms	(92.08)	902	FaulWord2
	3	2 ms	1 ms	(92.09)	903	FaulWord3
	1	2 ms	1 ms	(92.10)	904	FaulWord4
(70.24) + 7	2	2 ms	1 ms	(92.11)	906	AlarmWord1
	3	2 ms	1 ms	(92.12)	907	AlarmWord2
	1	10 ms	20 ms	(92.13)	908	AlarmWord3
(70.24) + 9	2	10 ms	20 ms	(92.14)	803	LimWord
	3	10 ms	20 ms	(92.15)	805	DI StatWord
	1	10 ms	20 ms	(92.16)	806	DO StatWord
<i>(70.24)</i> + 11	2	10 ms	20 ms	(92.17)	124	BridgeTemp
	3	10 ms	20 ms	(92.18)	122	Mot1TempMeas
	1	10 ms	20 ms	(93.01)		
<i>(70.24)</i> + 13	2	10 ms	20 ms	(93.02)		
	3	10 ms	20 ms	(93.03)		
	1	10 ms	20 ms	(93.04)		
<i>(70.24)</i> + 15	2	10 ms	20 ms	(93.05)		
	3	10 ms	20 ms	(93.06)		

#### Note:

The update time is the time within the drive is reading values from the data sets. Since the drive is a slave, the actual communication cycle time depends on the master's cycle time.

#### Fieldbus communication (N-type)

The communication between the N-type fieldbus adapter and the SDCS-COM-8 uses data sets. The data set base address is set by means of *CH0 DsetBaseAddr* (70.24) = 1. The communication for the fieldbus adapters is activated by means of *CommModule* (98.02) = **COM-8/Nxxx**. The contents of the fieldbus data sets is set by means of the same pointers as for the ABB overriding control data sets - see sections <u>Received data set table</u> and <u>Transmitted data set table</u>. Received and transmitted values are set according to groups 90 to 93. Also the update times are the same.

# Ch1 I/O devices

All optional I/O devices are connected via AIMA-01 board to Ch1. The SDCS-COM-8 is the master in the communication link. Each device has an individual address, set with switches on the I/O device. Before use, each I/O device must be activated by means of a parameter in group 98. See also:

I/O Module Adapter AIMA-01; User's Manual

# **Ch2 Master-follower link**

#### General

The master-follower link is designed for applications in which the system is operated by several drives and the shafts are coupled to each other via gearing, chains, belts etc. The master controls all followers via a fiber optic serial communication link. Pulse encoders are recommended for the master and all followers.

The master is typically speed controlled and the other drives follow the master's torque or speed reference. In general, torque control or window control of the followers should be used when the motor shafts of the master and the followers drives are fixed coupled to each other via gearing, chains, belts etc. and no speed differences between the drives is possible.

#### Link configuration

Ch2 on the SDCS-COM-8 board is used for the master-follower link between the drives. Ch2 is configurable by *Ch2 MaFoMode (70.09)* either to be master or follower in the communication in broadcast mode. Typically the speed controlled process master drive is configured also to be the communication master.

#### Master

The master mode is selected by *Ch2 MaFoMode (70.09)*. The torque reference source address is defined in the master by *Ch2 MasSig3 (70.12)* to be sent via broadcast to the followers. Also two other signals can be sent through the link if required. Their addresses are defined by *Ch2 MasSig1 (70.10)* and *Ch2 MasSig2 (70.11)*. Typical / default addresses are:

Signal ad	Signal addresses in the master				
Update	Parameter name and index of the default	Master drive selection			
time	values	parameters			
2 ms	MainCtrlWord (7.01) or UsedMCW (7.04)	Ch2 MasSig1 (70.10)			
2 ms	SpeedRefUsed (2.17)	Ch2 MasSig2 (70.11)			
2 ms	TorqRef3 (2.10)	Ch2 MasSig3 (70.12)			

Above parameters are not valid in the follower. The master cyclically sends *Ch2 MasSig1* ... *3* in one DDCS message as broadcast every 2 ms.

#### Followers

The follower mode is selected by *Ch2 MaFoMode (70.09)*. To control start and stop from the master set *CommandSel (10.01)* = **MainCtrlWord**. The connections are selected by *Ch2 FolSig1 (70.18)*, *Ch2 FolSig2 (70.19)* and *Ch2 FolSig3 (70.20)* according to the following table:

Signal addresses in the follower			
Update	Parameter name and index of the	Follower drive selection parameters	
time	default values		
2 ms	MainCtrlWord (7.01)	Ch2 FolSig1 (70.18)	
2 ms	SpeedRef (23.01)	Ch2 FolSig2 (70.19)	
2 ms	TorqRefA (25.01)	Ch2 FolSig3 (70.20)	

Above parameters are not valid in the master. The follower cyclically reads *Ch2 FolSig1 ... 3* every 2 ms.

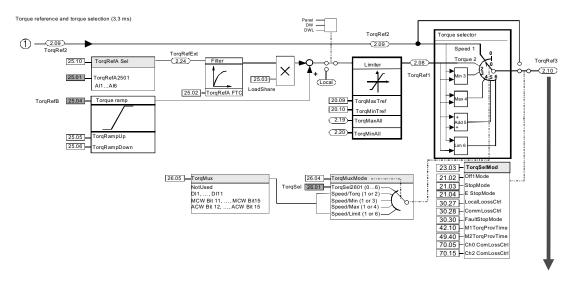

#### Note:

In default setting master signal *TorqRef3 (2.10)* is send via master parameter *Ch2 MasSig3 (70.12)* to follower signal *TorqRefA (25.01)* via follower parameter *Ch2 FolSig3 (70.20)*.

#### **Firmware structure**

#### Master:

*Ch2 MaFoMode (70.09)* = **Master**, activates read pointer *Ch2 MasSig1 (70.10)*, *Ch2 MasSig2 (70.11)* and *Ch2 MasSig3 (70.12)* 

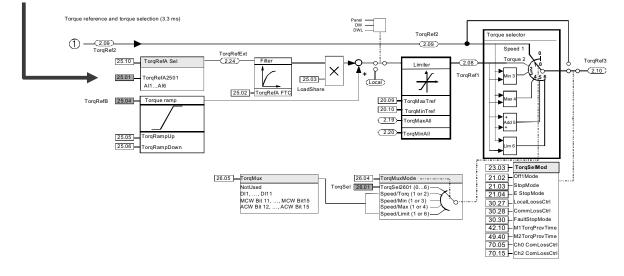

Master parameter *Ch2 MasSig3 (70.12)* = 210 sends the torque value to the follower

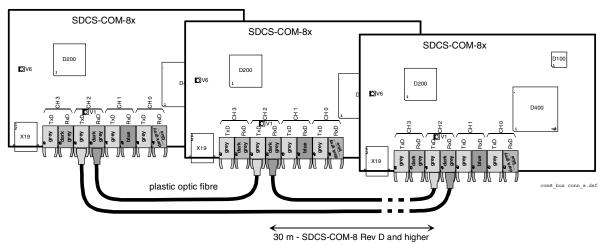

#### Follower:

*Ch2 MaFoMode (70.09)* = **Follower**, activates write pointer *Ch2 FolSig1 (70.18)*, *Ch2 FolSig2 (70.19)* and *Ch2 FolSig3 (70.20)* 

Follower parameter *Ch2 FolSig3* (70.20) = 2501 gets the torque value from the master

#### Master-follower firmware structure

Master-follower fiber optic cable connection (see also DCS800 Hardware Manual)

#### Toggle between speed- and torque control

In some application, both speed- and torque control of the followers are required, e.g. if it is necessary to accelerate all drives along the same speed ramp up to a certain speed before the torque control can be started. In those cases, a flying switch over between speed- and torque controls is required. The switch over can be done by e.g. the overriding control using *TorqSel (26.01)*. See also *TorqMux (26.05)* and *TorqMuxMode (26.04)*.

#### **Follower diagnostics**

All the followers receive the torque reference via *TorqRefA (25.01)*. All followers are able to detect communication breaks, after the first valid message is received. The action due to a communication break is defined by *Ch2 TimeOut (70.14)* and *Ch2 ComLossCtrl (70.15)*. Feedback for all alarms and faults from the followers must be handled by the overriding control through the Ch0 on the SDCS-COM-8 board.

#### Master-follower link specification

**Size of the link:** One master and maximum ten followers are allowed. If more than ten followers are required, a local ABB agent should be consulted.

**Configuration:** Link is configurable by the overriding control using *Ch2 MaFoMode (70.09)*. This makes possible to change between master and follower by the overriding control without changes in the hardware.

Transmission rate: 4 Mbit/s

Total performance of the link: 2 ms (between master and followers)

Protocol: Distributed Drives Communication System, DDCS

# Ch3 commissioning and maintenance tools

# DriveWindow

DriveWindow can be connected to Ch3 in either ring (max. 5 drives) or star connection using NDBU-xx branching units, see *Ch3 HW Config (70.21)*. The node numbers - *Ch3 NodeAddr (70.32)* - must be set for each drive individually before starting the communication through the connection. This setting has to be made by a point to point connection using the DCS800 Control Panel, DriveWindow or DriveWindow Light. The new node address becomes valid after the next SDCS-COM-8 power-up. The SDCS-COM-8 Ch3 has been configured to be a slave in the communication point of view. With *DeviceName (99.09)* and DriveWindow it is possible to fill in a string (name) with a maximum of 12 characters for individual drive identification. See also:

Configuration Instructions NDBU-85/95; 3ADW000100, Optical DDCS Communication Link; 3BFE64285513 and DDCS Cabling and Branching; 3AFE63988235

# Ethernet communication for monitoring with Ethernet adapter NETA-01

#### General

This chapter gives information using the Ethernet adapter NETA-01 together with the DCS800.

#### NETA-01 - DCS800

The Ethernet communication for monitoring with the drive requires the options NETA-01 and SDCS-COM-8.

The NETA-01 is connected to the SDCS-COM-8 usually via Ch3. Ch0 can be used as well.

Following browser based remote monitoring functions are released for DC-drives:

- Parameters Read and write parameters
- Signals
   Read signals

•	Olghais	
٠	Fault logger	Show fault logger
		Clear fault logger
		Save faults to a file in the NETA-01
		Download saved fault logger files via FTP
•	Data logger	Select values and set all trigger conditions
		Upload samples and show as values or as graphs
		Save samples as files in the NETA-01
		Download saved data logger files via FTP
•	Status word	MainStatWord (8.01) is shown after clicking on the lamp
		Note:
		Bit 11 (EXT_CTRL_LOC) and bit 12 (RUN_ENABLE)
		are not used for DC-drives

#### Note:

Data set communication and motor control (e.g. local control of the drives via NETA-01) are not released for the DCS800.

#### **Related documentation**

User's Manual Ethernet Adapter Module NETA-01.

The quoted page numbers correspond to the User's Manual.

#### **NETA-01 configuration**

The NETA-01 homepage can be called by using a browser (e.g. internet explorer). **Note:** 

Before connecting the NETA-01 via Ch3 with the DCS800 check, that *Tool Channel (Ch3)* of the NETA-01 configuration is ticked otherwise group 51 (Fieldbus) will be overwritten.

#### Note:

When connecting the NETA-01 with the DCS800 make sure to use Ch3 (tool channel) on the SDCS-COM-8, otherwise group 51 (Fieldbus) will be overwritten. Ch0 can be used too, but then group 51 (Fieldbus) will be overwritten and cannot be used for other serial communication.

Configuration			(	Configu	ration		
	Drives	Network	Dataset	Scanning P	arameters	Advanced Option	ns
DCS800	NDBU Baudr	Star Adress:	0	Eth 	ernet DDCS Pr = disabled)	ort: 46823	
					ОК	Cance	el

More details about the NETA-01 configuration see page 55 of the User's Manual.

#### Mechanical and electrical installation

The adapter module is mounted onto a standard mounting rail outside the drive.

# **Drive configuration**

The DCS800 needs no special settings when using Ch3 concerning the released functions.

Firmware compatibility:

SDCS-CON-4: firmware version 1.8 or higher, see *FirmwareVer (4.01)* SDCS-COM-8: firmware version 1.3 or higher, see *Com8SwVersion (4.11)* 

# CANopen communication with fieldbus adapter RCAN-01

#### General

This chapter gives additional information using the CANopen adapter RCAN-01 together with the DCS800.

#### RCAN-01 - DCS800

The CANopen communication with the drive requires the option RCAN-01.

#### **Related documentation**

User's Manual CANopen Adapter Module RCAN-01.

The quoted page numbers correspond to the User's Manual.

#### **Overriding control configuration**

Supported operation mode is PDO21 (see page 43 and 44).

#### EDS file

The EDS file for RCAN-01 and DCS800 is available. Please ask Your local ABB agent for the newest one concerning the current DCS800 firmware.

#### Mechanical and electrical installation

If not already done so insert RCAN-01 into slot 1 of the drive.

#### **Drive configuration**

The CANopen adapter is activated by means of *CommModule (98.02)*. Please note that the DCS800 works with the operation mode **PDO21** (see page 43 and 44).

#### Parameter setting example 1 using group 51

Communication via group 51 is using 4 data words in each direction. The following table shows the parameter setting using group 51.

Drive parameters	Settings	Comments
CommandSel (10.01)	MainCtrlWord	
Ref1Sel (11.03)	SpeedRef2301	
CommModule (98.02)	Fieldbus	

ModuleType (51.01)	CANopen*	
Node ID (51.02)	1**	set node address as required
Baudrate (51.03)	8**	8 = 1 MBits/s
PDO21 Cfg (51.04)	1	0 = Configuration via CANopen objects 1 = Configuration via RCAN-01 adapter parameters

# **ControlNet communication with fieldbus adapter RCNA-01**

#### General

This chapter gives additional information using the ControlNet adapter RCNA-01 together with the DCS800.

#### RCNA-01 - DCS800

The ControlNet communication with the drive requires the option RCNA-01.

#### **Related documentation**

User's Manual ControlNet Adapter Module RCNA-01.

The quoted page numbers correspond to the User's Manual.

#### **Overriding control configuration**

Please refer to the Scanner documentation for information how to configure the system for communication with RCNA-01.

#### EDS file

The EDS file for RCNA-01 and DCS800 is available. Please ask Your local ABB agent for the newest one concerning the current DCS800 firmware.

#### Mechanical and electrical installation

If not already done so insert RCNA-01 into slot 1 of the drive (see page 17).

#### **Drive configuration**

The ControlNet adapter is activated by means of *CommModule (98.02)*. Please note that the DCS800 works with the instances **User transparent assembly** and **Vendor specific assembly**.

The instances **Basic speed control** and **Extended speed control** (instance 20 / 70 and 21 / 71) are supported since firmware version 2.x. With these instances it is not possible to use the full flexibility of the DCS800. For more information see User's Manual.

#### Parameter setting example 1 using ABB Drives assembly

**ABB Drives assembly** is using 2 data words in each direction. The following table shows the parameter setting using this profile.

Drive parameters	Settings	Comments
CommandSel (10.01)	MainCtrlWord	
Ref1Sel (11.03)	SpeedRef2301

51.24	Input I/O par 8	=	17		6,2	92.08	DsetXplus5Val2	=	902
51.25	Input I/O par 9	=	18		6,3	92.09	DsetXplus5Val3	=	903

Setting of parameter groups 51, 90 and 92

\*For proper communication shown values have to be used

Setting of parameter groups 51, 90 and 92 depending on desired data words

#### **Further information**

Output and input parameters 51.08, ..., 51.25 can also be connected directly to the desired DCS800 parameters. In this case please take care that the RCNA-01 adapter gets the changed values and also take care, that the used parameters are deleted from group 90 to prevent data trouble.

#### Switch on sequence

Please see the example at the end of this chapter.

# **DeviceNet communication with fieldbus adapter RDNA-01**

#### General

This chapter gives additional information using the DeviceNet adapter RDNA-01 together with the DCS800.

#### RDNA-01 - DCS800

The DeviceNet communication with the drive requires the option RDNA-01.

#### **Related documentation**

User's Manual DeviceNet Adapter Module RDNA-01.

The quoted page numbers correspond to the User's Manual.

#### **Overriding control configuration**

Supported assemblies with DCS800 are **ABB Drives assembly** (Output instance: 100; Input instance: 101) and **User specific assembly** (Output instance: 102; Input instance: 103) (see page 35). The assemblies **Basic speed control** and **Extended speed control** (20 / 70 and 21 / 71) are supported since DCS800 firmware version 2.x.

#### EDS file

The EDS file for RDNA-01 and DCS800 is available. Please ask Your local ABB agent for the newest one concerning the current DCS800 firmware.

#### Mechanical and electrical installation

If not already done so insert RDNA-01 into slot 1 of the drive (see page 21).

#### **Drive configuration**

The DeviceNet adapter is activated by means of *CommModule (98.02)*. Please note that the DCS800 works with the instances **ABB Drives assembly** and **User specific assembly**.

The instances **Basic speed control** and **Extended speed control** (20 / 70 and 21 / 71) are supported since firmware version 2.x. With these instances it is not possible to use the full flexibility of the DCS800. For more information see User's Manual.

#### Parameter setting example 1 using ABB Drives assembly

**ABB Drives assembly** is using 2 data words in each direction. The following table shows the parameter setting using this profile.

Setting of parameter groups 51, 90 and 92

\*For proper communication shown values have to be used

Setting of parameter groups 51, 90 and 92 depending on desired data words

#### **Further information**

Output and input parameters 51.08, ..., 51.25 can also be connected directly to the desired DCS800 parameters. In this case please take care that the RDNA-01 adapter gets the changed values and also take care, that the used parameters are deleted from group 90 to prevent data trouble.

#### Switch on sequence

Please see the example at the end of this chapter.

# Ethernet/IP communication with fieldbus adapter RETA-01

#### General

This chapter gives additional information using the Ethernet adapter RETA-01 together with the DCS800.

#### **RETA-01 - DCS800**

The Ethernet/IP communication with the drive requires the option RETA-01.

#### **Related documentation**

User's Manual Ethernet Adapter Module RETA-01.

The quoted page numbers correspond to the User's Manual.

#### EDS file

The EDS file for RETA-01 and DCS800 is available. Please ask Your local ABB agent for the newest one concerning the current DCS800 firmware.

#### Mechanical and electrical installation

If not already done so insert RETA-01 into slot 1 of the drive.

#### **Drive configuration**

The Ethernet adapter is activated by means of *CommModule (98.02)*. Please note that the DCS800 works with the instances 102 / 103, if *Protocol (51.16)* is set to **2 (Ethernet/IP ABB Drives communication profile)**. The instances 100 / 101, 20 / 70 and 21 / 71 are supported since firmware version 2.x, if *Protocol (51.16)* is set to **1 (Ethernet/IP AC/DC communication profile)**. With these instances it is not possible to use the full flexibility of the DCS800. For more information see User's Manual.

#### Parameter setting example using Ethernet/IP ABB Drives communication profile Ethernet/IP ABB Drives communication profile uses up to 4 data words in each direction by default. The internal connection from and to the DCS800 has to be done by means of parameter group 51.

**Ethernet/IP ABB Drives communication profile** uses up to 12 data words in each direction. The configuration has to be done via fieldbus link configuration using Vendor Specific Drive I/O Object (Class 91h).

		up of the holdbus ddupter.

\* Read-only or automatically detected by Ethernet adapter

\*\* If all DIP switches (S1) are OFF; the IP address is set according to parameters 51.04, ..., 51.07. In case at least one DIP switch is on, the last byte of the IP address [*IP address 4 (51.07)*] is set according to the DIP switches (see page 42).

# DCS800 parameter setting using **Ethernet/IP ABB Drives communication** profile

#### Note:

 $\pm$  20.000 speed units (decimal) for speed reference [*SpeedRef* (23.01)] and speed actual [*MotSpeed* (1.04)] corresponds to the speed shown in *SpeedScaleAct* (2.29). That speed is set by means of *M1SpeedScale* (50.01) respectively *M1SpeedMin* (20.01) or *M1SpeedMax* (20.02).

#### Up to 4 data words

The content of Input/Output 1 to 4 can be configured with the RETA-01 configuration parameters. Please see table RETA-01 Ethernet/IP configuration parameters, which contains all the necessary basic settings.

#### Up to 12 data words

The DCS800 supports up to 12 data words in each direction. The first configuration of the RETA-01 adapter has to be done according to the table RETA-01 Ethernet/IP configuration parameters, which contains all the necessary basic settings.

The additional desired data words have to be configured via the fieldbus network using Vendor Specific Drive I/O Object (Class 91h). The adapter will automatically save the configuration.

The table RETA-01 Ethernet/IP configuration parameters shows the index configuration numbers and the corresponding data words (via data sets).

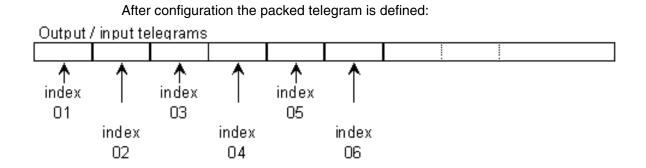

**Please note:** The grayed index is also addressed via group 51, please set the outputs and inputs to the same configuration numbers as shown in the table RETA-01 Ethernet/IP configuration parameters. Example:

- Task: The  $5^{th}$  data word of the telegram (index05) should be connected to *AuxCtrlWord (7.03)*.
- To do: AuxCtrlWord (7.03) is the default content of DsetXplus2Val2 (90.05). The corresponding index configuration number of DsetXplus2Val2 (90.05) is 8. So the configuration has to be done using the following values in the IP address (all values are in hex):

service	0x10	(write single)	class	0x91	(drive IO map
					function)
instance	0x01	(output)	attribute	5	(index05)
data	08 00	(2 char hex value)

# Modbus (RTU) communication with fieldbus adapter RMBA-01

#### General

This chapter gives additional information using the Modbus adapter RMBA-01 together with the DCS800.

#### RMBA-01 - DCS800

The Modbus communication with the drive requires the option RMBA-01. The protocol Modbus RTU (**R**emote **T**erminal **U**nit using serial communication) is supported.

#### **Related documentation**

User's Manual Modbus Adapter Module RMBA-01.

The quoted page numbers correspond to the User's Manual.

#### Mechanical and electrical installation

If not already done so insert RMBA-01 into a slot of the drive. Slot 1 has to be used, if the Modbus should control the drive.

#### **Drive configuration**

The Modbus adapter is activated by means of *CommModule (98.02)* and *ModBusModule2 (98.08)*.

The serial communication parameters of the RMBA-01 adapter have to be set by means of group 52.

Up to 12 data words in each direction are possible.

#### Parameter setting example ...

The Modbus adapter can be either used to control the drive with the overriding control system or only for monitoring purposes together with another fieldbus which is responsible for the control. Therefore different parameter settings are necessary.

#### ... when controlling a drive

In data set mode (cyclic communication) the drive will be controlled from the overriding control using the Modbus.

Up to 12 data words in each direction are possible. The following table shows the parameter settings.

Drive parameters	Settings	Comments
CommandSel (10.01)	MainCtrlWord	
Ref1Sel (11.03)	SpeedRef2301	
CommModule (98.02)	Modbus	
ModBusModule2 (98.08)	Slot1	

StationNumber (52.01)	1,, 247	desired station number
BaudRate (52.02)	5	5 = 9600 Baud
Parity (52.03)	4	4 = Even

DsetXVal1 (90.01)	701, default	MainCtrlWord (7.01); output data word 1 (control word) 1 <sup>st</sup> data word from overriding control to drive (40001 => data word 1.1)
DsetXVal2 (90.02)	2301, default	SpeedRef (23.01); output data word 2 (speed reference) 2 <sup>nd</sup> data word from overriding control to drive (40002 => data word 1.2)
DsetXVal3 (90.03)	2501, default	<i>TorqRefA (25.01)</i> ; output data word 3 (torque reference) 3 <sup>rd</sup> data word from overriding control to drive (40003 => data word 1.3)
up to,,		
DsetXplus6Val3 (90.12)	0, default	not connected; output data word 12 (not connected) 12 <sup>th</sup> data word from overriding control to drive (40021 <= data word 7.3)
	-	
DsetXplus1Val1 (92.01)	801, default	MainStatWord (8.01); input data word 1 (status word) 1 <sup>st</sup> data word from drive to overriding control (40004 <= data word 2.1)
DsetXplus1Val2 (92.02)	104, default	MotSpeed (1.04); input data word 2 (speed actual) 2 <sup>nd</sup> data word from drive to overriding control (40005 <= data word 2.2)
DsetXplus1Val3 (92.03)	209, default	<i>TorqRef2 (2.09)</i> ; input data word 3 (torque reference) 3 <sup>rd</sup> data word from drive to overriding control (40006 <= data word 2.3)
up to,,		
DsetXplus7Val3 (92.12)	907, default	Alarmword2 (9.07); input data word 12 (alarm word 2) 12 <sup>th</sup> data word from drive to overriding control (40024 <= data word 8.3)

DCS800 parameter setting using a Modbus controlling the drive

#### Note:

New settings of group 52 take effect only after the next power up of the adapter.

#### Note:

 $\pm$  20.000 speed units (decimal) for speed reference [*SpeedRef* (23.01)] and speed actual [*MotSpeed* (1.04)] corresponds to the speed shown in *SpeedScaleAct* (2.29). That speed is set by means of *M1SpeedScale* (50.01) respectively *M1SpeedMin* (20.01) or *M1SpeedMax* (20.02).

#### ... when used for monitoring only

For monitoring only read commands are supported.

Up to 24 data words for monitoring are possible, because the 12 data words written to by the overriding control (see group 90) can also be read. The following table shows the parameter settings.

Drive parameters	Settings	Comments
CommModule (98.02)	FldBusModbus	FldBusModbus means controlling the drive by means of another R-type fieldbus adapter - see description of <i>CommModule (98.02)</i>
ModBusModule2 (98.08)	Slot2 or	depends on the location of the
	Slot3	adapter

StationNumber (52.01)	1,, 247	desired station number
BaudRate (52.02)	5	5 = 9600 Baud
Parity (52.03)	4	4 = Even

DsetXVal1 (90.01)	701, default	MainCtrlWord (7.01); output data word 1 (control word) 1 <sup>st</sup> data word from overriding control to drive (40001 => data word 1.1)
DsetXVal2 (90.02)	2301, default	SpeedRef (23.01); output data word 2 (speed reference) 2 <sup>nd</sup> data word from overriding control to drive (40002 => data word 1.2)
DsetXVal3 (90.03)	2501, default	<i>TorqRefA (25.01)</i> ; output data word 3 (torque reference) 3 <sup>rd</sup> data word from overriding control to drive (40003 => data word 1.3)
up to,, DsetXplus6Val3 (90.12)	0, default	not connected; output data word 12 (not connected) 12 <sup>th</sup> data word from overriding control to drive (40021 <= data word 7.3)

DsetXplus1Val1 (92.01)	801, default	MainStatWord (8.01); input data word 1 (status word) 1 <sup>st</sup> data word from drive to overriding control (40004 <= data word 2.1)
DsetXplus1Val2 (92.02)	104, default	MotSpeed (1.04); input data word 2 (speed actual) 2 <sup>nd</sup> data word from drive to overriding control (40005 <= data word 2.2)
DsetXplus1Val3 (92.03)	209, default	<i>TorqRef2 (2.09)</i> ; input data word 3 (torque reference) 3 <sup>rd</sup> data word from drive to overriding control (40006 <= data word 2.3)
up to,, DsetXplus7Val3 (92.12)	907, default	Alarmword2 (9.07); input data word 12 (alarm word 2) 12 <sup>th</sup> data word from drive to overriding control (40024 <= data word 8.3)

DCS800 parameter setting using a Modbus monitoring the drive

#### Note:

New settings of group 52 take effect only after the next power up of the adapter.

#### Note:

 $\pm$  20.000 speed units (decimal) for speed reference [*SpeedRef* (23.01)] and speed actual [*MotSpeed* (1.04)] corresponds to the speed shown in *SpeedScaleAct* (2.29). That speed is set by means of *M1SpeedScale* (50.01) respectively *M1SpeedMin* (20.01) or *M1SpeedMax* (20.02).

# Modbus/TCP communication with fieldbus adapter RETA-01

#### General

This chapter gives additional information using the Ethernet adapter RETA-01 together with the DCS800.

#### **RETA-01 - DCS800**

The Modbus/TCP communication with the drive requires the option RETA-01. The protocol Modbus TCP (Ethernet) is supported.

#### **Related documentation**

User's Manual Ethernet Adapter Module RETA-01.

The quoted page numbers correspond to the User's Manual.

#### Mechanical and electrical installation

If not already done so insert RETA-01 into slot 1 of the drive.

#### **Drive configuration**

The Ethernet adapter is activated by means of *CommModule (98.02)*. Please note that the DCS800 works with **Modbus/TCP**, if *Protocol (51.16)* is set to 0 (**Modbus/TCP**).

#### Parameter setting example using Modbus/TCP

**Modbus/TCP** is using 4 data words in each direction. The following table shows the parameter setting using this protocol.

Drive parameters	Settings	Comments
CommandSel (10.01)	MainCtrlWord	
Ref1Sel (11.03)	SpeedRef2301	
CommModule (98.02)	Fieldbus	

DsetXVal1 (90.01)	701, default	MainCtrlWord (7.01); output data word 1 (control word) 1 <sup>st</sup> data word from overriding control to drive

Communication

\* Read-only or automatically detected by Ethernet adapter \*\* If all DIP switches (S1) are OFF; the IP address is set according to parameters 51.04, ..., 51.07. In case at least one DIP switch is on, the last byte of the IP address [*IP address 4 (51.07)*] is set according to the DIP switches (see page 42).

DCS800 parameter setting using Modbus/TCP protocol

#### Note:

 $\pm$  20.000 speed units (decimal) for speed reference [*SpeedRef* (23.01)] and speed actual [*MotSpeed* (1.04)] corresponds to the speed shown in *SpeedScaleAct* (2.29). That speed is set by means of *M1SpeedScale* (50.01) respectively *M1SpeedMin* (20.01) or *M1SpeedMax* (20.02).

### Switch on sequence

Please see the example at the end of this chapter.

# Profibus communication with fieldbus adapter RPBA-01

#### General

This chapter gives additional information using the Profibus adapter RPBA-01 together with the DCS800.

### **RPBA-01 - DCS800**

The Profibus communication with the drive requires the option RPBA-01.

#### **Related documentation**

User's Manual PROFIBUS DP Adapter Module RPBA-01.

The quoted page numbers correspond to the User's Manual.

#### **Overriding control configuration**

Supported operation mode is **VENDOR SPECIFIC** for ABB Drives (see page 19 and 20).

The RPBA-01 uses data consistent communication, meaning that the whole data frame is transmitted during a single program cycle. Some overriding controls handle this internally, but others must be programmed to transmit data consistent telegrams.

#### Mechanical and electrical installation

If not already done so insert RPBA-01 into slot 1 of the drive (see page 21).

### **Drive configuration**

The Profibus adapter is activated by means of *CommModule (98.02)* (see page 22).

Please note that the DCS800 works only with the ABB Drives profile.

### Parameter setting example 1 using PPO Type 1

ABB Drives profile (Vendor-specific) with **PPO Type 1** (DP-V0) (see page 25). The first two data words (PZD1 OUT, PZD2 OUT) from the overriding control to the drive are fixed connected as control word and speed reference at the Profibus side and cannot be changed.

The first two data words (PZD1 IN, PZD2 IN) from the drive to the overriding control are fixed connected as status word and speed actual at the Profibus side and cannot be changed.

Drive parameters	Settings	Comments
CommandSel (10.01)	MainCtrlWord	
Ref1Sel (11.03)	SpeedRef2301

DP Mode (51.21)	0	
FBA PAR REFRESH (51.27)	DONE, default	If a fieldbus parameter is changed its new value takes effect only upon setting <i>FBA</i> <i>PAR REFRESH (51.27)</i> = <b>RESET</b> or at the next power up of the fieldbus adapter.

\* Read-only or automatically detected by Profibus adapter

DCS800 parameter setting using **PPO Type 1** 

#### Note:

 $\pm$  20.000 speed units (decimal) for speed reference [*SpeedRef* (23.01)] and speed actual [*MotSpeed* (1.04)] corresponds to the speed shown in *SpeedScaleAct* (2.29). That speed is set by means of *M1SpeedScale* (50.01) respectively *M1SpeedMin* (20.01) or *M1SpeedMax* (20.02).

### Parameter setting example 2 using PPO types 2, 4 and 5

The first two data words (PZD1 OUT, PZD2 OUT) from the overriding control to the drive are fixed connected as control word and speed reference at the Profibus side and cannot be changed.

The first two data words (PZD1 IN, PZD2 IN) from the drive to the overriding control are fixed connected as status word and speed actual at the Profibus side and cannot be changed.

Further data words are to be connected to desired parameters respectively signals by means of parameters in group 51:

- PZD3 OUT (51.05) means 3<sup>rd</sup> data word from overriding control to drive,
- PZD3 IN (51.06) means 3<sup>rd</sup> data word from Drive to overriding control to
- *PZD10 OUT (51.18)* means 10<sup>th</sup> data word from overriding control to drive,
- *PZD10 IN (51.19)* means 10<sup>th</sup> data word from drive to overriding control or by means of setting parameters in group 90 and group 92.

## **Communication via group 51**

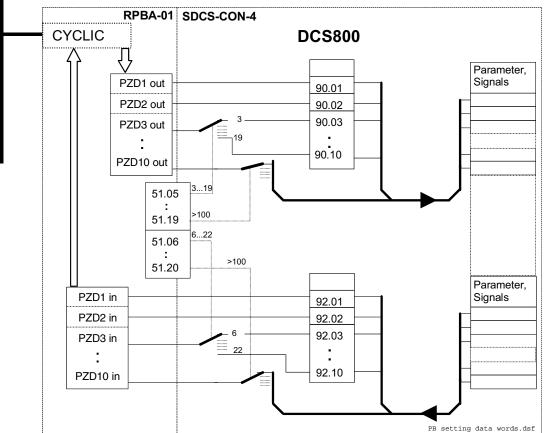

E.g. the 3<sup>rd</sup> data word from overriding control to drive should be the torque reference and the 3<sup>rd</sup> data word from the drive to the overriding control should be the actual motor torque. Therefore following settings have to be made:

- PZD3 OUT (51.05) = 2501 [TorqRefA (25.01)] and
- *PZD3 IN (51.06)* = 107 [*MotTorqFilt (1.07)*].

After changing parameters in group 51 please don't forget to reset the RPBA-01 adapter by means of *FBA PAR REFRESH* (51.27) = **RESET**. Now the corresponding parameters in group 90 and group 92 are disabled. **Attention:** 

Make sure, that the used parameters, like *TorqRefA (25.01)* are removed from groups 90 and 91.

Setting of data words using only group 51 or using group 90 and group 92

### Communication via group 90 and group 92

The other possibility - perhaps more familiar - is to connect via group 90 and group 92.

Again the 3<sup>rd</sup> data word from overriding control to drive should be the torque reference and the 3<sup>rd</sup> data word from the drive to the overriding control should be the actual motor torque. Therefore following settings have to be made (values see table below):

- *PZD3 OUT (51.05)* = 3 and
- *PZD3 IN (51.06)* = 6.

After changing parameters in group 51 please don't forget to reset the RPBA-01 adapter by means of *FBA PAR REFRESH* (51.27) = **RESET**. Now the corresponding parameters in group 90 and group 92 are enabled. Following settings have to be made now:

- DsetXVal3 (90.03) = 2501 [TorqRefA (25.01)] and
- DsetXplus1Val3 (92.03) = 107 [MotTorqFilt (1.07)].

Configuration numbers of each data word and its corresponding pointer

# **Adaptive Program (AP)**

### **Chapter overview**

This chapter describes the basics of the Application Program and instructs how to build an application. All needed parameters can be found in the groups 83 to 86.

#### What is the Adaptive Program

Conventionally, the user can control the operation of the drive by parameters. Each parameter has a fixed set of choices or a setting range. The parameters make adapting of the drive easy, but the choices are limited. It is not possible to customize the drive any further. AP makes customizing possible without the need of a special programming tool or language:

- AP is using function blocks,
- DWL AP is the programming and documentation tool.

The maximum size of AP is 16 function blocks. The program may consist of several separate functions.

#### Features

The Adaptive Program of DCS800 provides the following features:

- 16 function blocks
- more than 20 block types
- password protection
- 4 different cycle times selectable
- shift functions for function blocks
- debug functions
  - output forcing
  - breakpoint
  - single step
  - single cycle
- additional output write pointer parameter for each block (group 86)
- 10 additional user constants (group 85) used as data container

#### How to build the program

The programmer connects a function block to other blocks through a Block Parameter Set. The sets are also used for reading values from the firmware and transferring data to the firmware. Each Block Parameter Set consists of six parameters in group 84 and a write pointer in group 86.

The programmer connects a function block to other blocks through a Block Parameter Set. The sets are also used for reading values from the firmware and transferring data to the firmware. Each Block Parameter Set consists of six parameters in group 84 and a write pointer in group 86. The figure below shows the use of Block Parameter Set 1 in the firmware (parameters 84.04 to 84.09 and 86.01):

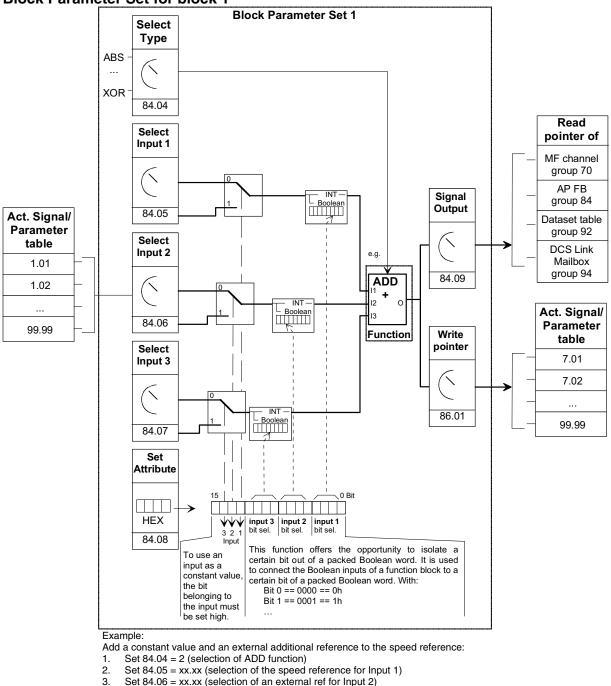

- *Block1Type (84.04)* selects the function block type.
- *Block1In1 (84.05)* selects the source of IN1. A negative value means that the source will be inverted.
- *Block1In2 (84.06)* selects the source of IN2. A negative value means that the source will be inverted.
- Block1In3 (84.07) selects the source of IN3. A negative value means that the source will be inverted.
- Block1Attrib (84.08) defines the attributes of the inputs.
- Block1Output (84.09) provides the value of the function block output, which can be used further for other input selections. The user cannot edit this parameter value.
- The output value is also available in write pointer *Block1Out (86.01)*.
   *Block1Out (86.01)* contains the destination parameter, into which the value is written.

#### How to connect the Application Program with the firmware

The outputs of the Adaptive Program need to be connected to the firmware. For that purpose there are two possibilities:

- The outputs, e.g. *Block1Output (84.09),* can be selected for further functions.
- The output values are available in the write pointers, e.g. *Block1Out (86.01)*. These parameters contain the destination parameters, into which the values are written.

154

#### **Block Parameter Set for block 1**

Set 84.06 = xx.xx (selection of an external ref for Input 2)

Set 84.07 = 1500 (constant value for Input 3) 4

5. Set 84.08 = 4000h (because Input 3 = constant  $\Rightarrow$  Bit 14=1  $\Rightarrow$  4000h)

6. Set 86.01 = xx.xx (write processed value to destination parameter for further processing)

7. 84.09: contains the processed value

# How to control the execution of the program

The Adaptive Program executes the function blocks in numerical order according to the block number 1, ..., 16. All blocks use the same time level. This cannot be changed by the user. The user can:

- select the operation mode of the program (stop, start, editing, single cycling, single stepping)
- adjust the execution time level of the program and
- activate or de-activate blocks.

# **DWL AP**

## General

Another way to create applications is with DWL AP. It is a program plugged into DriveWindow Light and can be opened with *Tools* and *DriveAP for DCS800*:

🗏 DriveWindow Light 2 - [Parameter Browser - DC5800]									
Tools Communication Window Help									
CoDeSys Application Download									
DriveAP for DCS800									
Sequence Programming Col									

# Important keys and buttons

DWL AP is controlled by means of following keys and buttons:

Keys and buttons	Function
Ctrl + left mouse button on a box	Change / insert function blocks, connect
or function block	in- and outputs in <b>Edit</b> mode
Shift + left mouse button on the	View actual values in Start mode
red cross	
Cancel	Abort the action
Help	Open the online help

## Program modes

There are 5 modes for the Adaptive Program, see *AdapProgCmd* (83.01):

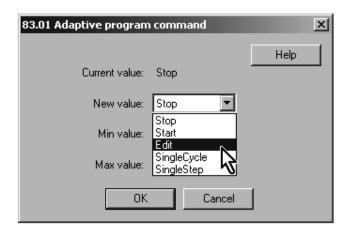

- Stop: the Adaptive Program is not running and cannot be edited,
- **Start:** the Adaptive Program is running and cannot be edited,
- Edit: the Adaptive Program is not running and can be edited,
- SingleCycle and SingleStep are used for testing.

### Change to Edit mode

Use Ctrl + left mouse button on 83.01 Adaptive Program Control

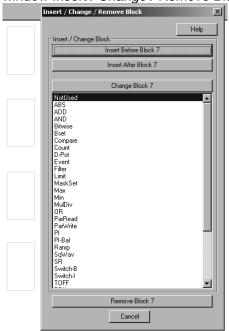

and set to Edit:

### Insert function blocks

Use *Ctrl + left mouse button* on one of the yellow boxes. This opens the pop-up window *Insert / Change / Remove Block*:

In this manner it is possible to insert up to 16 function blocks from the list to the desktop. With the button *Change Block xx* the selected block will be changed. The button *Insert Before Block xx* means that the new block will be inserted before the selected block. Button *Insert After Block xx* means that the new block will be inserted after the selected block.

Insert Before Block 6
Insert After Block 6
Change Block 6

## **Connect function blocks**

Function blocks can be connected to other blocks or to firmware parameters. To connect use *Ctrl* + *left mouse button* on the red cross at the input. This opens the pop-up window *Set Pointer Parameter*. This window provides several connection possibilities:

 Connect a *Parameter* from the list and set the bit in case of connecting a packed boolean value:

iet Pointer Parame	ter (84.05)		
			Help
Parameter	7.01 MainCtr/Word	Bit 10	Inverted
	3.28 Flux Ref Sum 5.03 Al1 5.04 Al2		
Constant	5.04 AI2 5.05 AI3 5.06 AI4		
O Advanced	7.01 MainCtr/Word 7.02 AuxCtr/Word 7.03 AuxCtr/Word2		
	7.04 used MCW 7.05 D0 CtrfWord		
C Undefined	8.01 MainStafWord 8.02 AuxStafWord 8.05 DI StafWord		
	9.01 FaultWord1 9.02 FaultWord2		
OK	9.03 FaultWord3 9.04 FaultWord4 9.05 UserFaultWord		
Cancel	9.06 AlarmWord1	•	

- Connect a *Constant* value to the input:

Set Pointer Paramete	er (84.05)	×
		Help
C Parameter	100	
Constant		
C Advanced		
O Undefined		
OK		
Cancel		

 In Advanced mode choose the parameter with group \* 100 + index, e.g. MainCtrlWord (7.01) == 701:

3ADW000193R0701 DCS800 Firmware Manual e g

Set Pointer Parameter	(84.05)		×
			Help
C Parameter	701	Bit 10	Inverted
O Constant			
Advanced			
O Undefined			
OK Cancel			

- Select Undefined if no connection is required:

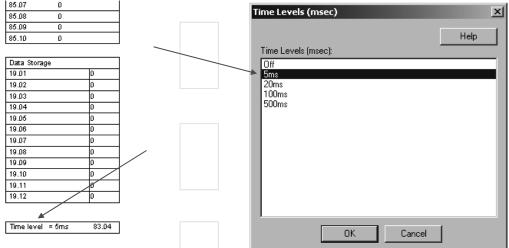

Set Pointer Parameter (84.05)	×
	Help
C Parameter	
O Constant	
C Advanced	
OK Cancel	

 Connections of outputs to firmware parameters can be done by means of the output pointers on the right side of the desktop:

· ·	-			
Block 4		Block1Out	86.01	0
AND		Block1OutSign	al	0
84.22				
X		Block2Out	86.02	0
×		Block2OutSign	al	0
	84.27			
X-IN3 OUT	04.21	Block3Out	86.D3	0
		Block3OutSign	al	0
		Block4Out	86.04	701
	•	Block4Out Sign	al	0

If an output of a function block should be connected with an input of a function block simply select the output's parameter at the input.

#### Set the Time level

## **Saving AP applications**

It is possible to save AP applications as \*.ap files :

# **Function blocks**

## **General rules**

## The use of block input 1 (BlockxIn1) is compulsory (it must not be left

**unconnected).** Use of input 2 (BlockxIn2) and input 3 (BlockxIn3) is voluntary for the most blocks. As a rule of thumb, an unconnected input does not affect the output of the block.

The Attribute Input (BlockxAttrib) is to set with the attributes, like declaration of constant and bits, of all three inputs. DWL AP does this automatically. The constant attribute defines a block constant which can only be changed or modified in EDIT mode.

## **Block inputs**

The blocks use two input formats:

- integer or
- boolean

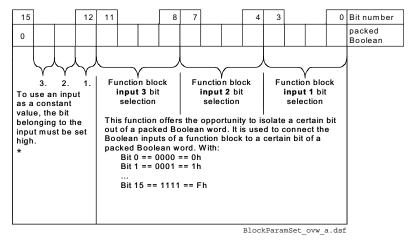

The used format depends on the function block type. For example, the ADD block uses integer inputs and the OR block boolean inputs.

#### Note:

The inputs of the block are read when the execution of the block starts, not simultaneously for all blocks!

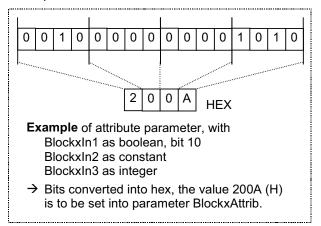

Block inputs gets the parameter of signal source or user constants (e.g. 85.01). Depending on the used block function and depending on the desired function the attributes of all three inputs are to be set as integer, constant or as selection of a bit of a 16-bit word source.

Therefore it is used a 16-bit word, which is defined as following:

\* this type of constant defines a Block Constant, which can only be modified in EDIT mode.

#### Example:

#### Parameter value as an integer input

How the block handles the input

The block reads the selected value in as an integer.

#### Note:

The parameter selected as an input should be an integer value. The internal scaling for each parameter can be found in chapter <u>*Parameters*</u>.

#### How to select the input

- Scroll to the input selection parameter of the block and switch to edit mode (Enter).
- Set the address, from which the input value is to be read, with group \* 100 + index, e.g. *AccTime1 (22.01)* = 2201. A negative address (e.g. -2201) will act an inversion of the connected value.

The figure below shows the DCS800 Control Panel display when the input BlockxIn1 (with e.g. x = 1 for 1. block) selection parameter is in edit mode.

#### Display of panel

	REM 🖱 PAR EDIT	
Connection to 503 as output of Al1 (group x 100 + index)		
	CANCEL	SAVE

#### Example:

Al1 is supplied with a voltage source of 5.8 V. Al1 is connected to the block as follows:

- Scroll to *Block1In1 (84.05)* and shift to edit mode (Enter). Set to 503, because the value of AI1 is shown in group 5 with index 3 *AI1 Val (05.03)* == 05 \* 100 + 3 = 503.
- The value at the input of the block is 5800, since the integer scaling of *Al1 Val* (05.03) is 1000 == 1 V see chapter <u>*Parameters*</u>.

How to set and connect the input

•Option 1

- Scroll to the input selection parameter of the block and switch to edit mode (Enter).
- Give the constant value to this input parameter (arrow keys).
- Accept by Enter.
- Scroll to attribute parameter, e.g. Block1Attrib (4.08).
- Set the bit for constant attribute of this input in Block1Attrib (4.08).
- Accept by Enter.

The constant may have a value from -32768 to 32767. The constant cannot be changed while the Application Program is running. The figures below shows the DCS800 Control Panel display when *Block1In2 (84.06)* is in edit mode and the constant field is visible:

Display of panel

	REM ひ PAR EDIT	
Value of the desired — constant	$\stackrel{8406 Block1In2}{\longrightarrow} -10000$	
	CANCEL	SAVE

#### Display of panel

	REM ひ PAR EDIT	
Setting of constant — value of Block1In2 input	$^{8408}$ Block1Attrib $\rightarrow 2000$ hex	
	CANCEL	SAVE

#### Option 2

• User constants 85.01 to 85.10 are reserved for the Adaptive Program and can be used for custom setting. Parameters 19.01 to 19.12 can be used in the same way, but are not stored in the flash.

• Connect the user constant to a block as usual by the input selection parameter. The user constants can be changed while the Adaptive Program is running. They may have values from -32767 to 32767.

#### Parameter value as a boolean input

#### How the block handles the input

The block:

- reads the selected value as an integer,
- uses the bit defined by the bit field as the boolean input and
- interprets bit value 1 as true and 0 as false.

#### Example:

The figure below shows the value of *Block1In3 (84.07)* when the input is connected to DI2. All digital inputs are available in *DI StatWord (8.05)*. Bit 0 corresponds to DI1 and bit 1 to DI2.

#### Display of panel

	REM 心 PAR EDIT	
Connection to 805 as— output of DI's (group x 100 + index)	ightarrow  m 8407~Block1ln3 $ ightarrow  m 805$	
	CANCEL	SAVE

#### Display of panel

	REM ひ PAR EDIT	
Setting of bit 1 of — block1In3	$ ightarrow  m 8408~Block1Attrib} ightarrow  m 0100~hex$	
	CANCEL	SAVE

#### Note:

The parameter selected as an input should have a packed boolean value (binary data word).

#### Constant as a boolean input

#### How to set and connect the input

- Scroll to the input selection parameter of the block and switch to edit mode (Enter).
- Give the constant. If boolean value true is needed, set the constant to 1. If boolean value false is needed, set to 0.
- Accept by Enter.
- Scroll to attribute parameter (BlockxAttrib).
- Set the bit for constant attribute of this input in BlockxAttrib parameter.
- Accept by Enter.

### String input

#### How to select the input

With the EVENT block the text from fault, alarm or notice lists will be selected. To change the text DriveWindow and SDCS-COM-8 are required.

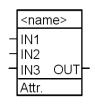

# **Function blocks**

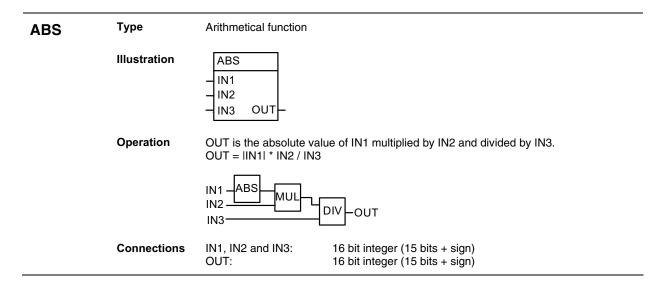

General

Each of the 16 function blocks has three input parameters IN1 to IN3, which can be connected to the firmware, outputs of other function blocks or constants. Boolean values are interpreted like this:

- 1 as true and
- 0 as false.

A 4<sup>th</sup> parameter is used for the attributes of the inputs. The attribute has to be edited manually, if the functions blocks are edited with the DCS800 Control Panel, DriveWindow or DriveWindow Light. The attribute is set automatically when DWL AP is used. The output OUT can connected with the inputs of function blocks. To write output values into firmware parameters connect the necessary output pointer (group 86) to the desired parameter.

ADD	Туре	Arithmetical function
	Illustration	ADD - IN1 - IN2 - IN3 OUT-
	Operation	OUT is the sum of the inputs. OUT = IN1 + IN2 + IN3
	Connections	IN1, IN2 and IN3:16 bit integer (15 bits + sign)OUT:16 bit integer (15 bits + sign)
AND	Туре	Logical function
	Illustration	AND - IN1 - IN2 - IN3 OUT
	Operation	OUT is true if all connected inputs are true. Otherwise the OUT is false. Truth table:
		IN1 IN2 IN3 OUT (binary) OUT (value on display)
		0 0 False (All bits 0) 0
		0 0 1 False (All bits 0) 0
		0 1 0 False (All bits 0) 0
		0 1 1 False (All bits 0) 0
		1 0 0 False (All bits 0) 0
		1         0         1         False (All bits 0)         0           1         1         0         False (All bits 0)         0
		1         0         False (All bits 0)         0           1         1         1         True (All bits 1)         -1
	Connections	IN1, IN2 and IN3: boolean OUT: 16 bit integer (packed boolean)

Bitwise	Туре	Logical function
	Illustration	Bitwise - IN1 - IN2 - IN3 OUT
	Operation	The block compares bits of three 16 bit word inputs and forms the output bits as follows: OUT = (IN1 OR IN2) AND IN3. Example: Single bit:
		$\begin{array}{c ccccccccccccccccccccccccccccccccccc$
		Example: Whole word: $ \begin{array}{  l l l l l l l l l l l l l l l l l l $
	Connections	IN3 IN3 I6 bit integer (packed boolean) OUT: 16 bit integer (packed boolean)

Bset	Туре	Logical function			
	Illustration	Bset IN1 IN2 IN3 OUT			
	Operation	With Bset it is possible to set the value of a certain bit in a word. Connect the word to be processed at IN1. Define the number of the bit to be changed at IN2. Define the desired bit value at IN3 (1 for true and 0 for false). OUT is the result of the operation			
	Connections	IN1:16-bit integer (packed boolean); word to be MainCtrlWord (7.01)IN2:0 15; bit to be changedIN3:boolean; desired bit valueOUT:16-bit integer (packed boolean), result	processed e.g.		
Compare	Туре	Arithmetical function			
	Illustration	Compare - IN1 - IN2 - IN3 OUT-			
	Operation	Output bits 0, 1 and 2 (bits 4 15 are not used): • If $IN1 > IN2 \Rightarrow OUT = 001 OUT$ bit 0 is true, • if $IN1 = IN2 \Rightarrow OUT = 010 OUT$ bit 1 is true and • if $IN1 < IN2 \Rightarrow OUT = 100 OUT$ bit 2 is true. Output bit 3: • If $IN1 > IN2$ , $OUT = 1ddd$ OUT bit 3 is true and remains true until $IN1 < (IN2 - IN3)$ , after which bit 3 is false.			
		$\begin{array}{c} \hline 2 \\ \hline 2 \\ \hline 1 \\ \hline 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1$			
		Output bit 415: not used OUT integer value, which is shown on display, is the sum	of the bits:		
		bit 3         bit 2         bit 1         bit 0         OUT (value on disp           0         0         0         0         0         0           0         0         0         1         1           0         0         1         0         2           0         1         0         2         0           1         0         0         8	lay)		
		1         0         0         1         9           1         0         1         0         10           1         1         0         0         12			
	Connections	IN1, IN2 and IN3: 16 bit integer values (15 bits + s	l		

Count	Туре	Arithmetical function
	Illustration	Count - IN1 - IN2 - IN3 OUT-
	Operation	The counter counts the rising edges of IN1. Rising edges at IN2 reset the counter. IN3 limits OUT. IN3 > 0: OUT increases to the set limit. IN3 < 0: OUT increases up to the absolute maximum value (32768). When the maximum value is reached the output will be set to 0 and the counter starts counting from zero.
	Connections	IN1:boolean; counts rising edgesIN2:boolean; reset input (high active)IN3:16 bit integer (15 bit + sign); limitOUT:15 bit integer (15 bit + sign); shows the counted value
D-Pot	Туре	Arithmetical function
	Illustration	D-Pot - IN1 - IN2 - IN3 OUT-
	Operation	IN1 increases OUT. IN2 decreases OUT. The absolute value of IN3 is the ramp time in ms which is needed to increase OUT from 0 to 32767. With positive IN3 the output range is limited from 0 to 32767. With negative IN3 the output range is between - 32767 and +32767. If both IN1 and IN2 are true, IN2 overwrites IN1.
	Connections	IN1:boolean; ramp upIN2:boolean; ramp downIN3:16 bit integer (15 bit + sign); ramp time scaleOUT:16 bit integer (15 bit + sign); ramp value

# Event

174

Max	Туре	Arithmetical function
	Illustration	Max - IN1 - IN2 - IN3 OUT-
	Operation	OUT is the highest input value. OUT = MAX (IN1, IN2, IN3) <b>Note:</b> An open input will ignored.
	Connections	IN1, IN2 and IN3:16 bit integer (15 bits + sign)OUT:16 bit integer (15 bits + sign)
Min	Туре	Arithmetical function
	Illustration	Min - IN1 - IN2 - IN3 OUT -
	Operation	OUT is the lowest input value. OUT = MIN (IN1, IN2, IN3)
		Note: An open input will be set to as zero.
	Connections	Input IN1, IN2 and IN3:16 bit integer values (15 bits + sign)Output OUT:16 bit integer (15 bits + sign)
MulDiv	Туре	Arithmetical function
	Illustration	MulDiv - IN1 - IN2 - IN3 OUT-
	Operation	OUT is the IN1 multiplied with IN2 and divided by IN3. OUT = (IN1 * IN2) / IN3
	Connections	Input IN1, IN2 and IN3: 16 bit integer values (15 bits + sign) Output OUT: 16 bit integer (15 bits + sign)

NotUsed	Туре	-
	Illustration	
	Operation	Block is not enabled and not working, default
	Connections	-
OR	Туре	Logical function
	Illustration	OR
		- IN2 - IN3 OUT-
	Oneration	OUT is true if any of the connected inputs is true. Otherwise the OUT is folds. Truth
	Operation	OUT is true if any of the connected inputs is true. Otherwise the OUT is false. Truth table:
		IN1 IN2 IN3 OUT (binary) OUT (value on display)
		0         0         False         (All bits 0)         0           0         0         1         True         (All bits 1)         -1
		0 1 0 True (All bits 1) -1
		0 1 1 True (All bits 1) -1
		1         0         0         True         (All bits 1)         -1           1         1         0         True         (All bits 1)         -1
		1         1         1         True         (All bits 1)         -1
	Connections	IN1, IN2 and IN3: boolean values OUT: 16 bit integer value (packed boolean)
ParRead	Туре	Parameter function
	Illustration	ParRead
		IN1
		- IN2
	Operation	OUT shows the value of a parameter, which is defined with IN1 as group and IN2 as
		index.
		Example: Reading <i>AccTime1 (22.01)</i> : IN1 = 22 and IN2 = 01
	Connections	IN1: 16 bit integer (15 bits + sign); group
		IN2: 16 bit integer (15 bits + sign); index
		IN3: not used OUT: 16 bit integer (15 bits + sign); parameter value

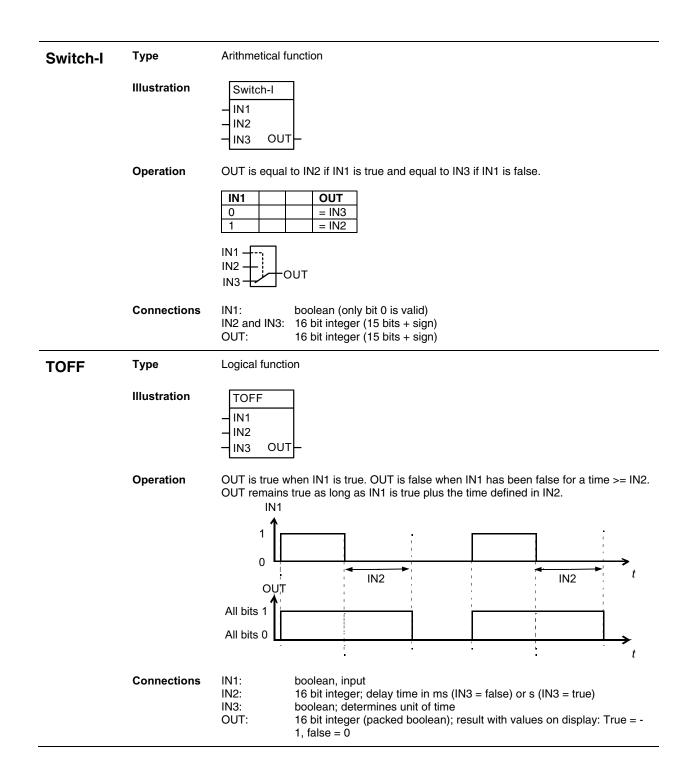

176

ParWrite	Туре	Parameter function
	Illustration	ParWrite - IN1 - IN2 - IN3 OUT
	Operation	Value of IN1 is written into a parameter defined by IN2 as group * 100 + index, e.g. MainCtrlWord (7.01) == 701. The block will be activated with a change of IN1. IN3 determines if the value is saved in the flash. Attention: Cyclic saving of values in the flash will damage it! Do not set IN3 constantly to true! OUT gives the error code, if parameter access is denied. Example: Set AccTime1 (22.01) = 150, not saving into flash: IN1 = 150, desired value IN2 = 2201, this must be a defined as a constant and not as a parameter IN3 = false
	Connections	IN1:16 bit integer (15 bits + sign); desired valueIN2:16 bit integer (15 bits + sign); group * 100 + indexIN3:boolean; true = save in flash, false = don't save in flashOUT:16 bit integer (packed boolean); error code
PI	Туре	Arithmetical controller
	Illustration	PI - IN1 - IN2 - IN3 OUT-
	Operation	OUT is IN1 multiplied by (IN2 / 100) plus integrated IN1 multiplied by (IN3 / 100). $O = I1 * I2 / 100 + (I3 / 100) * \int I1$ <b>Note:</b> The internal calculation uses 32 bits accuracy to avoid offset errors.
	Connections	IN1:       16 bit integer (15 bit + sign); error (e.g. speed error)         IN2:       16 bit integer (15 bit + sign); p-part (30 == 0.3, 100 == 1)         IN3:       16 bit integer (15 bit + sign); i-part (250 == 2.5, 5,000 == 50)         OUT:       16 bit integer (15 bits + sign); the range is limited from -20,000 to +20,000

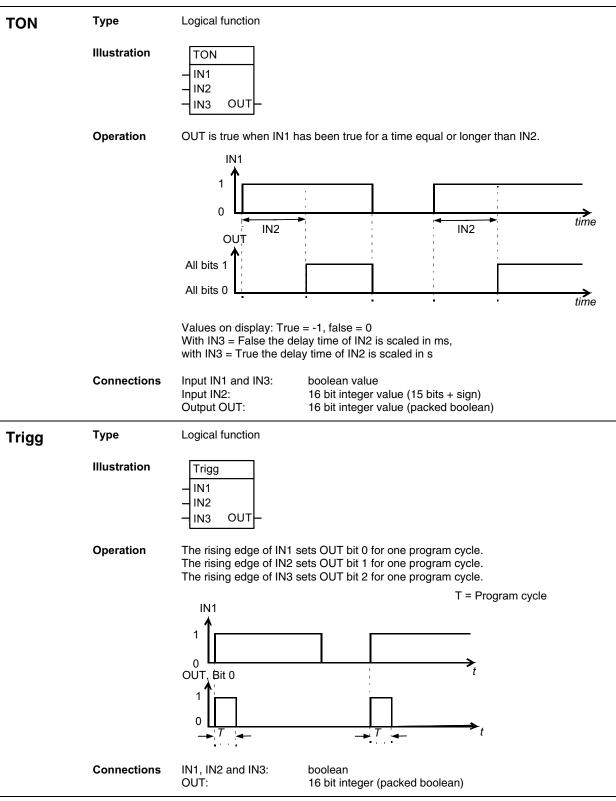

PI-Bal	Туре	Arithmetical function
	Illustration	PI-Bal – IN1 – IN2 – IN3 OUT –
	Operation	The PI-Bal block initializes the PI block. The PI-Bal block must follow directly behind the PI block and can only be used together with the PI block. When IN1 is true, the PI-Bal block writes the value of IN2 directly into OUT of the PI block. When IN1 is false, the PI-Bal block releases OUT of the PI block. Normal operation continues starting with the set output value - bumpless transition.
	Connections	IN1:boolean; true = balance PI block, false = no balancingIN2:16 bit integer (15 bits + sign); balance valueIN3:not usedOUT:affects PI block
Ramp	Туре	Arithmetical function
	Illustration	Ramp - IN1 - IN2 - IN3 OUT
	Operation	IN1 is the input. IN2 and IN3 are the times. OUT increases or decreases until the input value is reached.
	Connections	IN1:16 bit integer (15 bit + sign); ramp inputIN2:16 bit integer (15 bit + sign); ramp up time in ms (related to 20,000)IN3:16 bit integer (15 bit + sign); ramp down time in ms, (related to 20,000)OUT:16 bit integer (15 bit + sign); ramp output

Sqrt	Туре	Arithmetical function
	Illustration	Sqrt - IN1 - IN2 - IN3 OUT -
	Operation	OUT is the square root of IN1 * IN2. With IN3 = true IN1 and IN2 are read as absolute values:
		$OUT = \sqrt{ IN1  *  IN2 }$
		With IN3 = false OUT is set to zero if IN1 * IN2 is negative:
		$OUT = \sqrt{IN1^* IN2};  if \ IN1^* IN2 \ge 0$
		OUT = 0 if $IN1*IN2 < 0$
	Connections	IN1:16 bit integer (15 bits + sign)IN2:16 bit integer (15 bits + sign)IN3:booleanOUT:16 bit integer
SqWav	Туре	Arithmetical function
	Illustration	SqWav - IN1 - IN2 - IN3 OUT
	Operation	OUT alternates between the value of IN3 and zero (0), if the block is enabled with IN1 = true. The period is set with IN2 in ms.
	Connections	IN1:boolean; true = enable SqWav, false = disable SqWavIN2:16 bit integer; cycle time in msIN3:16 bit integer (15 bits + sign); height of square waveOUT:16 bit integer (15 bits + sign); square wave

SR	Туре	Logical function			
	Illustration	SR - IN1 - IN2 - IN3 OUT-			
	Operation	Set/reset block. IN1 (S) sets OUT. IN2 (R) or IN3 (R) reset OUT. If IN1, IN2 and IN3 are false, the current value remains at OUT. The SR is reset dominant. Truth table:IN1IN2IN3OUT (binary)OUT (value on display)000no changeno change001false (all bits 0)0010false (all bits 0)0011false (all bits 0)0100true (all bits 1)-1101false (all bits 0)0110false (all bits 0)011false (all bits 0)011false (all bits 0)011false (all bits 0)011false (all bits 0)0			
	Connections	IN1, IN2 and IN3: boolean OUT: 16 bit integer (15 bits + sign)			
Switch-B	Туре	Logical function			
	Illustration	Switch-B - IN1 - IN2 - IN3 OUT			
	Operation	OUT is equal to IN2 if IN1 is true. OUT is equal to IN3 if IN1 is false.			
		$ \begin{array}{c ccccccccccccccccccccccccccccccccccc$			
	Connections	IN1: boolean (only bit 0 is valid) IN2 and IN3: boolean

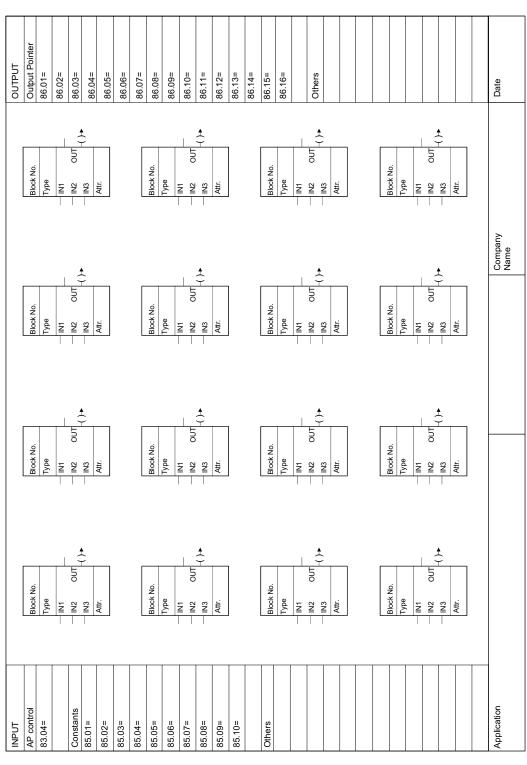

Adaptive Program

Diagram

### Signals and parameters

This chapter contains all signals and parameters.

### Signal groups list

Signals are measured and calculated actual values of the drive. This includes the control-, status-, limit-, fault- and alarm words. The drive's signals can be found in groups 1 to 9. None of the values inside these groups is stored in the flash and thus volatile.

### Note:

All signals in group 7 can be written to by means of DWL, DCS800 Control Panel, Adaptive Program, application program or overriding control.

The following table gives an overview of all signal groups:

Group	Description	Comment
1	Physical actual values	
2	Speed controller signals	
3	Reference actual values	
4	Information	self identification
5	Analog I/O	
6	Drive logic signals	
7	Control words	command words
8	Status / limit words	detection on operation and limits
9	Fault / alarm words	diagnosis information

Index	Signal / Parameter name	min.	max.	def.	unit	E/C
1.08	MotTorq (motor torque)         Motor torque in percent of MotNomTorque (4.23):         -       Filtered by means of a 6 <sup>th</sup> order FIR filter (sliding average filter), filter time is 1 mains voltage period.         Int. Scaling: 100 == 1 % Type:       SI       Volatile: Y				%	ш
2.17	SpeedRefUsed (used speed reference)         Used speed reference selected with:         -       Ref1Mux (11.02) and Ref1Sel (11.03) or         -       Ref2Mux (11.12) and Ref2Sel (11.06)         Int. Scaling: (2.29)       Type:       SI		ı		rpm	C

### Sample of signals

All signals are read-only. However the overriding control can write to the control words, but it only affects the RAM.

### Min., max., def.:

Minimum, maximum and default values are not valid for groups 1 to 9.

### Unit:

Shows the physical unit of a signal, if applicable. The unit is displayed in the DCS800 Control Panel and PC tools.

### E/C:

By means of *USI Sel (16.09)* it is possible to change between compact **(C)** and extended **(E)** signal and parameter list. The compact list contains only signals and parameters used for a typical commissioning.

### Group.Index:

Signal and parameter numbers consists of group number and its index.

### **Integer Scaling:**

Communication between the drive and the overriding control uses 16 bit integer values. The overriding control has to use the information given in integer scaling to read the value of the signal properly.

Example1:

If *MotTorq (1.08)* is read from the overriding control an integer value of 100 corresponds to 1 % torque.

Example2:

If *SpeedRefUsed (2.17)* is read from the overriding control 20.000 equals the speed (in rpm) shown in *SpeedScaleAct (2.29)*.

### Type:

The data type is given with a short code:

- I = 16-bit integer value (0, ..., 65536)
- SI = 16-bit signed integer value (-32768, ..., 32767)
- C = text string (ENUM)

### Volatile:

- Y = values are NOT stored in the flash, they will be lost when the drive is deenergized
- N = values are stored in the flash, they will remain when the drive is deenergized

## Parameter groups list

This chapter explains the function and valid values or selections for all parameters. They are arranged in groups by their function. The following table gives an overview of all parameter groups:

Group	Description
10	Start / stop select
11	Speed reference inputs
12	Constant speeds
13	Analog inputs
14	Digital outputs
15	Analog outputs
16	System control inputs
19	Data storage
20	Limits
21	Start / stop
22	Speed ramp
23	Speed reference
24	Speed control
25	Torque reference
26	Torque reference handling
30	Fault functions
31	Motor 1 temperature
34	DCS800 Control Panel display
40	PID control
42	Brake control
43	Current control
44	Field excitation
45	Field converter settings
47	12-pulse operation
49	Shared motion
50	Speed measurement
51	Fieldbus
52	Modbus
6069	Application program parameters
70	DDCS control
71	Drivebus
83	Adaptive Program control
84	Adaptive Program
85	<u>User constants</u>
86	Adaptive Program outputs
88	Internal
90	Receiving data sets addresses 1
91	Receiving data sets addresses 2
92	Transmit data sets addresses 1
93	Transmit data sets addresses 2
94	DCSLink control
97	Measurement
98	Option modules
99	Start-up data

Index	Signal / Parameter name	min.	max.	def.	unit	E/C
20.07	TorqMaxSPC (maximum torque speed controller)         Maximum torque limit - in percent of MotNomTorque (4.23) - at the output of the speed controller:         -       TorqRef2 (2.09)         Note:         The used torque limit depends also on the converter's actual limitation situation (e.g. other torque limits, current limits, field weakening). The limit with the smallest value is valid.         Int. Scaling:       100 == 1 % Type:         SI       Volatile: N	0	325	325	%	ш
23.01	SpeedRef (speed reference)Main speed reference input for the speed control of the drive. Can be connected to SpeedRefUsed $(2.17)$ via:-Ref1Mux (11.02) and Ref1Sel (11.03) or-Ref2Mux (11.12) and Ref2Sel (11.06)Internally limited from: $-(2.29) * \frac{32767}{20000} rpm to (2.29) * \frac{32767}{20000} rpm$ Int. Scaling: (2.29)Type:SIVolatile: Y	-10000	10000	0	rpm	C

### Sample of parameters

Parameter changes by DCS800 Control Panel, DriveWindow or DriveWindow Light are stored in the flash. Changes made by the overriding control are only stored in the RAM.

### Min., max., def.:

Minimum and maximum value or selection of parameter. Default value or default selection of parameter.

### Unit:

Shows the physical unit of a parameter, if applicable. The unit is displayed in the DCS800 Control Panel and PC tools.

### E/C:

By means of *USI Sel (16.09)* it is possible to change between compact **(C)** and extended **(E)** signal and parameter list. This influences parameter display of DCS800 Control Panel. The compact list contains only signals and parameters used for a typical commissioning.

### Group.Index:

Signal and parameter numbers consists of group number and its index.

### **Integer Scaling:**

Communication between the drive and the overriding control uses 16 bit integer values. The overriding control has to use the information given in integer scaling to change the value of the parameter properly.

Example1:

If *TorqMaxSPC (20.07)* is written to from the overriding control an integer value of 100 corresponds to 1 %.

Example2:

If *SpeedRef (23.01)* is written to from the overriding control 20.000 equals the speed (in rpm) shown in *SpeedScaleAct (2.29)*.

### Type:

The data type is given with a short code:

- I = 16-bit integer value (0, ..., 65536)
- SI = 16-bit signed integer value (-32768, ..., 32767)
- C = text string (ENUM)

### Volatile:

- Y = values are NOT stored in the flash, they will be lost when the drive is deenergized
- N = values are stored in the flash, they will remain when the drive is deenergized

Index	Signal / Parameter name	min.	max.	def.	unit E/C
Group 1	Physical actual values				
1.01	MotSpeedFilt (filtered motor speed)         Filtered actual speed feedback:         -       Choose motor speed feedback with M1SpeedFbSel (50.03)         -       Filtered with 1 s and         -       SpeedFiltTime (50.06)         Int. Index	Signal / Parameter name	min.	max.	def.	unit	E/C
	Idea of Window Control: The idea of the Window Control is to block the speed controller as long as the speed error ( $\Delta$ n) or speed actual remains within the window set by <i>WinWidthPos</i> (23.08) and <i>WinWidthNeg</i> (23.09). This allows the external torque reference - <i>TorqRef1</i> (2.08) - to affect the process directly. If the speed error ( $\Delta$ n) or actual speed exceeds the programmed window, the speed controller becomes active and influences the process by means of <i>TorqRef2</i> (2.09). To release window control set <i>TorqSel</i> (26.01) = Add and <i>AuxCtrlWord</i> (7.02) bit 7 = 1. This function could be called over/underspeed protection in torque control mode:					
	WinCtrlMode (23.12) = SpeedErrWin         TorqRef2 (2.09)					
	WinWidthPos (23.08) WinWidthPos (23.08) Window width $\Delta n = 0$					
	WinWidthNeg (23.09)					
	WinCtrlMode (23.12) = SpeedActWin         TorqRef2 (2.09)					
	WinWidthPos (23.08) speed actual WinWidthNeg (23.09)					
	► Time Note: to open a window with a width of 100 rpm set <i>WinWidthPos (23.08)</i> = 50 rpm and <i>WinWidthNeg</i> (23.09) = -50 rpm.					
23.07	WinIntegOn (window control integrator on)         Enables the integrator of the speed controller when window control is released:         0 = Off       Integrator of the speed controller is blocked when window control is released         1 = On       Integrator of the speed controller is enabled when window control is released         To release window control set TorqSel (26.01) = Add and AuxCtrlWord (7.02) bit 7 = 1.         Int. Scaling: 1 == 1       Type:       C	Off	Ō	Off		ш
23.08	<b>WinWidthPos (positive window width)</b> Positive speed limit for the window control, when the speed error ( $\Delta n = n_{ref} - n_{act}$ ) is positive. Internally limited from: $-(2.29)*\frac{32767}{20000}rpm$ to $(2.29)*\frac{32767}{20000}rpm$	-10000	10000	0	rpm	ш

Group 42	Brake control				
	Brake Control is activated by means of <i>M1BrakeCtrl (42.01)</i> and controls a mechanical brake automatically with the <b>Run</b> [ <i>MainCtrlWord (7.01)</i> bit 3] command. The internal logic is designed to meet the requirements of holding brakes, e.g. carriage drives or coilers, as well as the requirements for hanging load, e.g. cranes.				
Overvie Run comman [(7.01) bit 3	10     TorqProvOK     torque     Fisher     Sint U       [(7.03) bit 11]     proving     A116 BrakeLongFalling     ≥1     A122 MechBrake       M1TorqProvTime     (42.10) ≠ 0     M1BrakeAckSel     (42.13)     Image: Constraint of the state	Relea	ller	<b>_</b>

	StrtTorqRefGel(42.07) torque		-		iply_bvsd

Index	Signal / Parameter name	min.	max.	def.	unit	E/C
	All speed references have to be routed via the speed ramp.					
	With brake control <b>On</b> [ <i>M1BrakeCtrl</i> (42.01)] and <b>RdyRef</b> [ <i>MainStatWord</i> (8.01) bit 2] = 1 the torque proving is done, if selected. Afterwards the torque reference is set to <i>StrtTorqRef</i> (42.08) and the brake open (lift) command is given.					
	The brake open (lift) command <b>BrakeCmd</b> [ <i>AuxStatWord</i> (8.02) bit 8] is send delayed by <i>M1BrakeLiftDly</i> (42.11) to the brake. Then <i>M1BrakeLiftDly</i> (42.11) and <i>M1BrakeRefDly</i> (42.03) are started at the same time. During <i>M1BrakeRefDly</i> (42.03) the speed ramp is clamped to zero and the torque reference equals <i>StrtTorqRef</i> (42.08). After <i>M1BrakeRefDly</i> (42.03) is elapsed and the brake acknowledge - if selected with <i>M1BrakeAckSel</i> (42.02) - is active, clamp of speed reference is removed. This function compensates for the mechanical open (lift) delay of the brake.					
	With <b>Run</b> [ <i>UsedMCW</i> (7.04) bit 3] = 0 and motor speed below <i>M1ZeroSpeedLim</i> (20.03), <i>M1ZeroSpeedDly</i> (42.04) starts to compensate for the time the drive needs to decelerate from <i>M1ZeroSpeedLim</i> (20.03) to actual speed = 0. Until <i>M1ZeroSpeedDly</i> (42.04) is elapsed the brake is kept open (lifted).					
	After <i>M1ZeroSpeedDly</i> (42.04) is elapsed, the brake open (lift) command <b>BrakeCmd</b> [ <i>AuxStatWord</i> (8.02) bit 8] is removed and the brake close (apply) delay <i>M1BrakeStopDelay</i> (42.13) is started. During <i>M1BrakeStopDelay</i> (42.13) the motor control remains active with speed reference set to zero and the speed controller stays alive. This function compensates for the mechanical close (apply) delay of the brake.					
	The brake can be forced by ForceBrake [AuxCtrlWord2 (7.03) bit 12]         ForceBrake = 1       If ForceBrake is set the brake remains closed (applied).         If the Run [MainCtrlWord (7.01) bit 3] command is given to a drive in state RdyOn or RdyRef [MainStatWord (8.01) bit 0 and 1], the brake logic will be started up to the point of the brake open (lift) command.         A drive in state Running [MainStatWord (8.01) bit 2] will be stopped by ramp, the brake will be closed (applied), but the drive will remain in state Running.         ForceBrake = 0       The brake is controlled by the internal brake logic in group 42 (Brake control).

44.21	RevVoltMargin (reversal voltage margin) RevVoltMargin (44.21) - in percent of NomMainsVolt (99.10) - is a safety margin for the motor voltage during regenerative mode. Setting RevVoltMargin (44.21) to 0 provides no protection against commutation faults (shooting through). The function of RevVoltMargin (44.21) is the following: To prevent the drive from blowing fuses when going from motoring (using forward bridge) to generating (using reverse bridge) the armature voltage has to be lower than the corresponding mains voltage. This is automatically checked by the DCS800 and the reverse bridge is blocked as long as the armature voltage is too high. To lower the armature voltage two ways are possible: – lowering the motor speed by idling or – adapting the flux by lowering the field current - e.g. set FldCtrlMode (44.01) = EMF Both options take time and thus delaying the current / torque reversal. For faster adapting of the motor voltage activate the field weakening function. This can be supervised with CurCtrlStat2 (604) bit 3 U <sub>genMax</sub> ; max. regenerative voltage ( = 150') U <sub>genMax</sub> ; max. regenerative ( = 150') U <sub>genMax</sub> ; max. motoring voltage ( = 15') Motoring generating ( = 15') ( ) ( ) ( ) ( ) ( ) ( ) ( ) (	0	20	9	% L

45.10	FldRefHyst (field torque reference hysteresis) To prevent the field reversal from continuous toggling due to a too small torque reference a <i>TorqRefUsed (2.13)</i> hysteresis - in percent of <i>MotNomTorque (4.23)</i> - is available. The hysteresis is symmetrical and is set by <i>FldRefHyst (45.10)</i> . The field reversal is controlled by the sign of <i>TorqRefUsed (2.13)</i> : If <i>I</i> <i>FldRefHyst (45.10)</i> <i>TorqRefUsed (2.13)</i>	0	100	~	%	ш
	Note:FldRefHyst (45.10) is only effective for FldCtrlMode (44.01) = Fix/Rev or EMF/Rev.Int. Scaling: 100 = 1 % Type:IVolatile:N					

Signal / Parameter name	min.	max.	def.	unit	E/C
FldRefGain (field current reference gain) Optitorque calculates the field current reference depending on <i>TorqRefUsed (2.13)</i> . Thus, the field current is reduced to a smaller value, if <i>TorqRefUsed (2.13)</i> is accordingly low. This speeds up the field reversal, assuming <i>TorqRefUsed (2.13)</i> is low during field reversal. Optitorque is activated by means of <i>FldCtrlMode (44.01)</i> and like field reversal only available for motor 1 field exciter. The relation between <i>TorqRefUsed (2.13)</i> and <i>FldCurRefM1 (3.30)</i> is linear and without offset. It is defined by means of the <i>FldRefGain (45.11)</i> . The gain is related to <i>M1NomFldCur (99.11)</i> as well as to <i>MotNomTorque (4.23)</i> .	0	100	50	%	L

	100 %			
	Example: With <i>FldRefGain</i> (45.11) = 20 %, 100 % field current is generated at <i>TorqRefUsed</i> (2.13) = 20 %. <b>Note:</b> <i>FldRefGain</i> (45.11) is only effective for <i>FldCtrlMode</i> (44.01) = <b>Fix/Opti</b> , <b>EMF/Opti</b> , <b>Fix/Rev/Opti</b> or <b>EMF/Rev/Opti</b> . 94.01	DCSLinkNodelD (DCSLink node ID)         Defines the DCSLink node ID of the station. Two stations with the same node ID are not allowed.         Maximum allowed station count is 50. See also examples 1 to 5 above. The DCSLink node ID is inactive, if DCSLinkNodelD (94.01) is set to 0.         The drive trips with F508 I/OBoardLoss [FaultWord1 (9.01) bit 7], if the SDCS-DSL-4 board is chosen, but not connected or faulty.         Int. Scaling: 1 == 1       Type:       I       Volatile: N	0	63	0		Ш
94.02	BaudRate (baud rate)         Defines the transfer rate of the DCSLink. The transfer rate decreases with the total length of the DCSLink cable:         0 = 20 kBit/s       20 kBit/s, total cable length max. 500 m         1 = 50 kBit/s       50 kBit/s, total cable length max. 500 m         2 = 125 kBit/s       125 kBit/s, total cable length max. 500 m         3 = 250 kBit/s       500 kBit/s, total cable length max. 500 m         3 = 250 kBit/s       500 kBit/s, total cable length max. 250 m         4 = 500 kBit/s       500 kBit/s, total cable length max. 100 m, default         5 = 800 kBit/s       800 kBit/s, total cable length max. 35 m         7 = 1 MBit/s       1 MBit/s, total cable length approximately 25 m         Note:       Maximum total cable length should not exceed 100 m. Maximum amount of connected stations is         50 (e.g. 25 drives including one external field exciter each).       Int. Scaling: 1 == 1	20 kBit/s	1 MBit/s	500 kBit/s	1	E
94.03	12P TimeOut (12-pulse timeout)         Time delay before a 12-pulse communication break is declared and F535 12PulseCom         [FaultWord3 (9.03) bit 2] is set.         12P TimeOut (94.03) is only active in the 12-pulse master.         The communication fault is inactive, if 12P TimeOut (94.03) is set to 0 ms.         Int. Scaling: 1 == 1 ms       Type:         I       Volatile: N	0	64000	100	ms	ш
94.04	12P SlaNode (12-pulse slave node ID)         Defines the DCSLink node ID of the 12-pulse slave drive in the 12-pulse master drive. See also examples 2 and 4 above. The 12-pulse node ID is inactive, if 12P SlaNode (94.04) is set to 0.         Int. Scaling: 1 == 1       Type:       I       Volatile: N	0	63	31	ı	ш
94.05	Unused					
94.06	Unused					
94.07	FexTimeOut (field exciter timeout)Time delay before a field exciter communication break is declared. Depending on the fex with the communication break either F516 M1FexCom [FaultWord1 (9.01) bit 15] or F519 M2FexCom [FaultWord2 (9.02) bit 2] is set.[FaultWord2 (9.02) bit 2] is set.FexTimeOut (94.07) is only active in the armature converter.The communication fault is inactive, if FexTimeOut (94.07) is set to 0 ms.Int. Scaling: 1 == 1 msType:IVolatile: N	0	64000	100	sm	ш
94.08	M1FexNode (motor 1 field exciter node ID)         Defines the DCSLink node ID of motor 1 field exciter in the drive. See also examples 1 to 4 above.         The field exciter node ID is inactive, if M1FexNode (94.08) is set to 0.         Note:         M1FexNode (94.08) is void, when M1UsedFexType (99.12) = NotUsed or OnBoard.         Int. 94.11	Unused					
	The drive-to-drive and master-follower communication utilizes 4 mailboxes to transfer data. Thus data transfer to any station in the system is possible. Each mailbox can transmit / receive up to 4 values. Positive mailbox node ID numbers only transmit data, negative only receive data. To get communication mailbox node ID pairs are needed.					
	Example 6: Drive-to-drive configuration, sending signals from drive 2 using <i>MailBox3 (94.24)</i> to drive 3 using <i>MailBox3 (94.24)</i> by means of 5 to transmit data and -5 to receive data. $ \begin{array}{r} 1^{\text{st}} \text{ drive} \\ P94.01 = 1 \\ P94.12 = 1 \\ P94.18 = -2 \\ P94.24 = 3 \\ P94.30 = -4 \\ \hline P94.12 = -3 \\ P94.30 = -6 \\ \hline P94.30 = -6 \\ \hline P94.01 = 3 \\ P94.30 = -6 \\ \hline P94.01 = 3 \\ P94.18 = 2 \\ P94.24 = -5 \\ \hline P94.18 = 2 \\ P94.24 = -5 \\ \hline P94.24 = -5 \\ $					
	P94.30 = 6					
	Example 7: Master-follower configuration; send TorqRef3 (2.10) from the master drive via MailBox1 (94.12) to TorqRefA (25.01) of the followers via MailBox2 (94.18). Master drive P94.01 = 1 P94.12 = 1 P94.14 = 210 (T <sub>ref3</sub> ) $2^{rid}$ follower drive P94.01 = 3 P94.20 = 2501 (T <sub>refA</sub> ) $2^{rid}$ follower drive P94.01 = 1 P94.20 = 2501 (T <sub>refA</sub> ) $10^{th}$ follower drive P94.01 = 11 P94.20 = 2501 (T <sub>refA</sub> )

# **DCS800 Control Panel operation**

# **Chapter overview**

This chapter describes the handling of the DCS800 Control Panel.

## Start-up

The commissioning configures the drive and sets parameters that define how the drive operates and communicates. Depending on the control and communication requirements, the commissioning requires any or all of the following:

- The Start-up Assistant (via DCS800 Control Panel or DriveWindow Light) steps you through the default configuration. The DCS800 Control Panel Start-up Assistant runs automatically at the first power up, or can be accessed at any time using the main menu.
- Application macros can be selected to define common, system configurations.
- Additional adjustments can be made using the DCS800 Control Panel to manually select and set individual parameters. See *chapter <u>Signal and</u>* <u>parameter list</u>.

# **DCS800 Control Panel**

Use the DCS800 Control Panel to control the drive, to read status data, to adjust parameters and to use the pre-programmed assistants.

## Features:

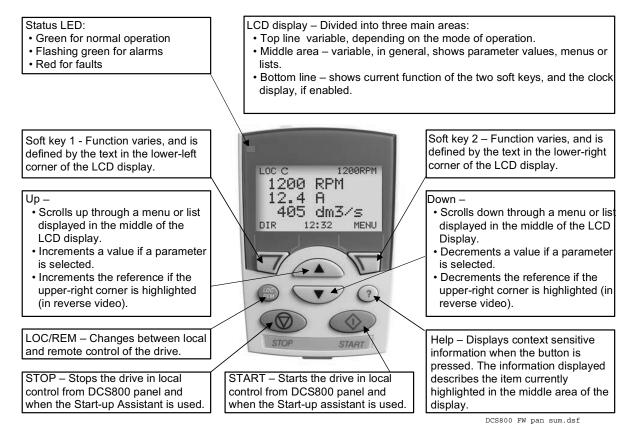

The DCS800 Control Panel features:

- Alphanumeric LCD display
- Language selection for the display by means of Language (99.01)
- Panel can be connected or detached at any time
- Start-up Assistant for ease drive commissioning
- Copy function, parameters can be copied into the DCS800 Control Panel memory to be downloaded to other drives or as backup
- Context sensitive help

Fault- and alarm messages including fault history

## **Display overview**

The following table summarizes the button functions and displays of the DCS800 Control Panel.

# General display features

#### Soft key functions:

The soft key functions are defined by the text displayed just above each key.

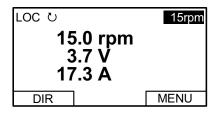

## **Display contrast:**

To adjust display contrast, simultaneously press the MENU key and UP or DOWN, as appropriate.

## Output mode

Use the output mode to read information on the drive's status and to operate the drive. To reach the output mode, press EXIT until the LCD display shows status information as described below.

## Status information:

**Top:** The top line of the LCD display shows the basic status information of the drive:

- LOC indicates that the drive control is local from the DCS800 Control Panel.
- REM indicates that the drive control is remote, via local I/O or overriding control.
- $\mathcal{V}$  indicates the drive and motor rotation status as follows:

DCS800 Control Panel display	Significance
Rotating arrow (clockwise or counter clockwise)	<ul> <li>Drive is running and at setpoint</li> <li>Shaft direction is forward 2 or reverse 3</li> </ul>
Rotating dotted blinking arrow	Drive is running but not at setpoint
Stationary dotted arrow	Start command is present, but motor is not running. E.g. start enable is missing

 Upper right position shows the active reference, when in local from DCS800 Control Panel.

**Middle:** Using parameter Group 34, the middle of the LCD display can be configured to display up to three parameter values:

- By default, the display shows three signals.
- Use DispParam1Sel (34.01), DispParam2Sel (34.08) and DispParam3Sel (34.15) to select signals or parameters to display. Entering value 0 results in no value displayed. For example, if 34.01 = 0 and 34.15 = 0, then only the signal or parameter specified by 34.08 appears on the DCS800 Control Panel display.

Bottom: The bottom of the LCD display shows:

- Lower corners show the functions currently assigned to the two soft keys.
- Lower middle displays the current time (if configured to do so).

# **Operating the Drive:**

**LOC/REM**: Each time the drive is powered up, it is in remote control (REM) and is controlled as specified in *CommandSel (10.01)*.

To switch to local control (LOC) and control the drive using the DCS800 Control Panel, press the button.

 When switching from local control (LOC) to remote control (REM) the drive's status (e.g. **On**, **Run**) and the speed reference of the remote control are taken.

To switch back to remote control (REM) press the 🖾 button.

Start/Stop: To start and stop the drive press the START and STOP buttons.

Shaft direction: To change the shaft direction press DIR.

**Speed reference:** To modify the speed reference (only possible if the display in the upper right corner is highlighted) press the UP or DOWN button (the reference changes immediately).

The speed reference can be modified via the DCS800 Control Panel when in local control (LOC).

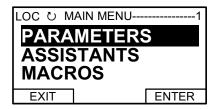

## Note:

The START / STOP buttons, shaft direction (DIR) and reference functions are only valid in local control (LOC).

## Other modes

Below the output mode, the DCS800 Control Panel has:

- Other operating modes are available through the MAIN MENU.
- A fault mode that is triggered by faults. The fault mode includes a diagnostic assistant mode.
- An alarm mode that is triggered by drive alarms.

## Access to the MAIN MENU and other modes:

To reach the MAIN MENU:

- 1. Press EXIT, as necessary, to step back through the menus or lists associated with a particular mode. Continue until you are back to the output mode.
- 2. Press MENU from the output mode. At this point, the middle of the display is a listing of the other modes, and the top-right text says "MAIN MENU".
- 3. Press UP/DOWN to scroll to the desired mode.
- 4. Press ENTER to enter the mode that is highlighted.

Following modes are available in the MAIN MENU:

- 1. Parameters mode
- 2. Start-up assistants mode
- 3. Macros mode (currently not used)
- 4. Changed parameters mode

- 5. Fault logger mode
- 6. Clock set mode
- 7. Parameter backup mode
- 8. I/O settings mode (currently not used)

The following sections describe each of the other modes.

#### Parameters mode:

Use the parameters mode to view and edit parameter values:

1. Press UP/DOWN to highlight PARAMETERS in the MAIN MENU, then press ENTER.

2. Press UP/DOWN to highlight the appropriate parameter group, then press SEL.

LOC ひ PAR GROUPS	01
99 Start-up data	
01 Phys Act Values	
02 SPC Signals	
03 Ref/Act Values	
04 Information	
EXIT	SEL

3. Press UP/DOWN to highlight the appropriate parameter in a group, then press EDIT to enter PAR EDIT mode.

LOC ひ PARAMETERS			
9901 Language			
9902 M1NomVolt			
350 V			
9903 M1NomCur			
9904 M1BaseSpeed			
EXIT	EDIT		

## Note:

The current parameter value appears below the highlighted parameter.

4. Press UP/DOWN to step to the desired parameter value.

LOC ひ PAR EDIT			
9902 M1NomVolt			
60 V			
CANCEL SAVE			

## Note:

To get the parameter default value press UP/DOWN simultaneously.

- 5. Press SAVE to store the modified value and leave the PAR EDIT mode or press CANCEL to leave the PAR EDIT mode without modifications.
- 6. Press EXIT to return to the listing of parameter groups, and again to step back to the MAIN MENU.

#### Start-up assistants mode:

Use the start-up assistants mode for basic commissioning of the drive. When the drive is powered up the first time, the start-up assistants guides you through the setup of the basic parameters.

There are seven start-up assistants available. They can be activated one after the other, as the ASSISTANTS menu suggests, or independently. The use of the assistants is not required. It is also possible to use the parameter mode instead. The assistant list in the following table is typical:

-				
1.	Name plate data	Enter the motor data, the mains (supply) data, the most important protections and follow the instructions of the assistant. After filling out the parameters of this assistant it is - in most cases - possible to turn the motor for the first time.		
2.	Macro assistant	Selects an application macro.		
3.	Autotuning field current controller	<ul> <li>Enter the field circuit data and follow the instructions of the assistant.</li> <li>During the autotuning the main respectively field contactor will be closed, the field circuit is measured by means of increasing the field current to nominal field current and the field current control parameters are set. The armature current is not released while the autotuning is active and thus the motor should not turn.</li> <li>When the autotuning is finished successfully the parameters changed by the assistant are shown for confirmation. If the assistant fails it is possible to enter the fault mode for more help.</li> </ul>		
4.	Autotuning armature current controller	<ul> <li>Enter the motor nominal current, the basic current limitations and follow the instructions of the assistant.</li> <li>During the autotuning the main contactor will be closed, the armature circuit is measured by means of armature current bursts and the armature current control parameters are set. The field current is not released while the autotuning is active and thus the motor should not turn, but due to remanence in the field circuit about 40% of all motors will turn (create torque). These motors have to be locked.</li> <li>When the autotuning is finished successfully the parameters changed by the assistant are shown for confirmation. If the assistant fails it is possible to enter the fault mode for more help.</li> </ul>		
5.	Speed feedback assistant	<ul> <li>Enter the EMF speed feedback parameters, - if applicable - the parameters for the pulse encoder respectively the analog tacho and follow the instructions of the assistant.</li> <li>The speed feedback assistant detects the kind of speed feedback the drive is using and provides help to set up pulse encoders or analog tachometers.</li> <li>During the autotuning the main contactor and the field contactor - if existing - will be closed and the motor will run up to base speed [<i>M1BaseSpeed (99.04</i>]]. During the whole procedure the drive will be in EMF speed control despite the setting of <i>M1SpeedFbSel (50.03)</i>.</li> <li>When the assistant is finished successfully the speed feedback is set. If the assistant fails it is possible to enter the fault mode for more help.</li> </ul>		
6.	Autotuning speed controller	<ul> <li>Enter the motor base speed, the basic speed limitations, the speed filter time and follow the instructions of the assistant.</li> <li>During the autotuning the main contactor and the field contactor - if existing - will be closed, the ramp is bypassed and torque respectively current limits are valid. The speed controller is tuned by means of speed bursts up to base speed [<i>M1BaseSpeed (99.04)</i>] and the speed controller parameters are set.</li> <li>Attention:         <ul> <li>During the autotuning the torque limits will be reached.</li> <li>When the autotuning is finished successfully the parameters changed by the assistant are shown for confirmation. If the assistant fails it is possible to enter the fault mode for more help.</li> </ul> </li> </ul>		

DCS800 panel operation

	Attention: This assistant is using the setting of <i>M1SpeedFbSel (50.03</i> ). If using setti Encoder, Encoder2 or Tacho make sure the speed feedback is working properly!	
<ol> <li>Field weakening assistant (only used when maximum speed is higher than base speed)</li> </ol>	<ul> <li>Enter the motor data, the field circuit data and follow the instructions of the assistant.</li> <li>During the autotuning the main contactor and the field contactor - if existing - will be closed and the motor will run up to base speed [<i>M1BaseSpeed (99.04)</i>]. The EMF controller data are calculated, the flux linearization is tuned by means of a constant speed while decreasing the field current and the EMF controller respectively flux linearization parameters are set.</li> <li>When the autotuning is finished successfully the parameters changed by the assistant are shown for confirmation. If the assistant fails it is possible to enter the fault mode for more help.</li> </ul>	

- 1. Press UP/DOWN to highlight ASSISTANTS in the MAIN MENU, then press ENTER.
- 2. Press UP/DOWN to highlight the appropriate start-up assistant, then press SEL to enter PAR EDIT mode.
- 3. Make entries or selections as appropriate.
- 4. Press SAVE to save settings. Each individual parameter setting is valid immediately after pressing SAVE.
- 5. Press EXIT to step back to the MAIN MENU.

#### Macros mode:

Currently not used!

## Changed parameters mode:

Use the changed parameters mode to view and edit a listing of all parameter that have been changed from their default values:

- 1. Press UP/DOWN to highlight CHANGED PAR in the MAIN MENU, then press ENTER.
- 2. Press UP/DOWN to highlight a changed parameter, then press EDIT to enter PAR EDIT mode.

#### Note:

The current parameter value appears below the highlighted parameter.

3. Press UP/DOWN to step to the desired parameter value.

## Note:

To get the parameter default value press UP/DOWN simultaneously.

4. Press SAVE to store the modified value and leave the PAR EDIT mode or press CANCEL to leave the PAR EDIT mode without modifications.

## Note:

If the new value is the default value, the parameter will no longer appear in the changed parameter list.

5. Press EXIT to step back to the MAIN MENU.

## Fault logger mode:

Use the fault logger mode to see the drives fault, alarm and event history, the fault state details and help for the faults:

- Press UP/DOWN to highlight FAULT LOGGER in the MAIN MENU, then press ENTER to see the latest faults (up to 20 faults, alarms and events are logged).
- 2. Press DETAIL to see details for the selected fault. Details are available for the three latest faults, independent of the location in the fault logger.
- 3. Press DIAG to get additional help (only for faults).
- 4. Press EXIT to step back to the MAIN MENU.

## Clock set mode:

Use the Clock set mode to:

- Enable or disable the clock function.
- Select the display format.
- Set date and time.
- 1. Press UP/DOWN to highlight CLOCK SET in the MAIN MENU, then press ENTER.
- 2. Press UP/DOWN to highlight the desired option, then press SEL.
- 3. Choose the desired setting, then press SEL or OK to store the setting or press CANCEL to leave without modifications.
- 4. Press EXIT to step back to the MAIN MENU.

## Note:

To get the clock visible on the LCD display at least one change has to be done in the clock set mode and the DCS800 Control Panel has to be de-energized and energized again.

## Parameter backup mode:

The DCS800 Control Panel can store a full set of drive parameters.

- AP will be uploaded and downloaded.
- The type code of the drive is write protected and has to be set manually by means of *ServiceMode (99.06)* = **SetTypeCode** and *TypeCode (97.01)*.

The parameter backup mode has following functions:

UPLOAD TO PANEL: Copies all parameters from the drive into the DCS800 Control Panel. This includes both user sets (**User1** and **User2**) - if defined - and internal parameters such as those created by tacho fine tuning. The DCS800 Control Panel memory is non-volatile and does not depend on its battery. Can only be done in drive state **Off** and **Iocal** from DCS800 Control Panel.

DOWNLOAD FULL SET: Restores the full parameter set from the DCS800 Control Panel into the drive. Use this option to restore a drive, or to configure identical drives. Can only be done in drive state **Off** and **local** from DCS800 Control Panel.

## Note:

This download does not include the user sets.

DOWNLOAD APPLICATION: Currently not used!

The general procedure for parameter backup operations is:

1. Press UP/DOWN to highlight PAR BACKUP in the MAIN MENU, then press ENTER.

DCS800 panel operation

- 3. Wait until the service is finished, then press OK.
- 4. Press EXIT to step back to the MAIN MENU.

## I/O settings mode:

Currently not used!

# Maintenance

## Cleaning:

Use a soft damp cloth to clean the DCS800 Control Panel. Avoid harsh cleaners which could scratch the display window.

## **Battery:**

A battery is used in the DCS800 Control Panel to keep the clock function available and enabled. The battery keeps the clock operating during power interruptions. The expected life for the battery is greater than ten years. To remove the battery, use a coin to rotate the battery holder on the back of the control panel. The type of the battery is CR2032.

## Note:

The battery is **not** required for any DCS800 Control Panel or drive functions, except for the clock.

# **Fault tracing**

# **Chapter overview**

This chapter describes the protections and fault tracing of the drive.

## General

#### Fault modes

Depending on the trip level of the fault the drive reacts differently. The drive's reaction to a fault with trip level 1 and 2 is fixed. See also paragraph <u>Fault signals</u> of this manual. The reaction to a fault of level 3 and 4 can be chosen by means of *SpeedFbFltMode (30.36)* respectively *FaultStopMode (30.30)*.

# **Converter protection**

## Auxiliary undervoltage

If the auxiliary supply voltage fails while the drive is in **RdyRun** state (MSW bit 1), fault **F501 AuxUnderVolt** is generated.

Auxiliary supply voltage	Trip level
230 VAC	< 185 VAC
115 VAC	< 96 VAC

## Armature overcurrent

The nominal value of the armature current is set with M1NomCur (99.02).

The overcurrent level is set by means of *ArmOvrCurLev (30.09)*. Additionally the actual current is monitored against the overcurrent level of the converter module. The converter's actual overcurrent level can be read from *ConvOvrCur (4.16)*.

Exceeding one of the two levels causes F502 ArmOverCur.

#### **Converter overtemperature**

The maximum temperature of the bridge can be read from *MaxBridgeTemp* (4.17) and is automatically set by *TypeCode* (97.01) or manually set by *S MaxBrdgTemp* (97.04).

#### Note:

When setting the air entry temperature for D6 and D7 modules manually use MaxBrdgTemp (97.04) = 50 °C as absolute maximum.

Exceeding this level causes **F504 ConvOverTemp**. The threshold for **A104 ConvOverTemp** is 5 °C below the tripping level. The measured temperature can be read from *BridgeTemp* (1.24).

If the measured temperature drops below minus 10 °C, **F504 ConvOverTemp** is generated.

429

# Auto-reclosing (mains undervoltage)

Auto-reclosing allows continuing drive operation immediately after a short mains undervoltage without any additional functions in the overriding control system.

In order to keep the overriding control system and the drive control electronics running through short mains undervoltage, an UPS is needed for the 115/230 VAC auxiliary voltages. Without the UPS all DI like e.g. E-stop, start inhibition, acknowledge signals etc. would have false states and trip the drive although the system itself could stay alive. Also the control circuits of the main contactor must be supplied during the mains undervoltage.

Auto-reclosing defines whether the drive trips immediately with **F512 MainsLowVolt** or if the drive will continue running after the mains voltage returns. To activate the auto-reclosing set *PwrLossTrip* (30.21) = **Delayed**.

## Short mains undervoltage

The supervision of mains undervoltage has two levels:

- 1. UNetMin1 (30.22) alarm, protection and trip level
- 2. UNetMin2 (30.23) trip level

If the mains voltage falls below *UNetMin1 (30.22)* but stays above *UNetMin2 (30.23)*, the following actions take place:

- 1. the firing angle is set to ArmAlphaMax (20.14),
- 2. single firing pulses are applied in order to extinguish the current as fast as possible,
- 3. the controllers are frozen,
- 4. the speed ramp output is updated from the measured speed and
- 5. A111 MainsLowVolt is set as long as the mains voltage recovers before *PowrDownTime (30.24)* is elapsed, otherwise **F512 MainsLowVolt** is generated.

If the mains voltage returns before *PowrDownTime (30.24)* is elapsed and the overriding control keeps the commands **On** (MCW bit 0) and **Run** (MCW bit 3) = 1, the drive will start again after 2 seconds. Otherwise the drive trips with **F512 MainsLowVolt**.

When the mains voltage drops below *UNetMin2 (30.23)*, the action is selected by means of *PwrLossTrip (30.21)*:

- 1. the drive is immediately tripped with **F512 MainsLowVolt** or
- 2. the drive starts up automatically, see description for UNetMin1 (30.22). Below UNetMin2 (30.23) the field acknowledge signals are ignored and blocked

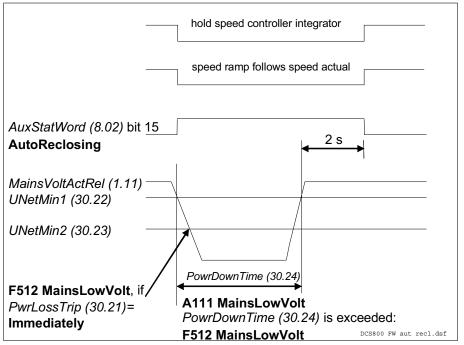

## Note:

UNetMin2 (30.23) isn't monitored, unless the mains voltage drops below UNetMin1 (30.22). Thus, for proper operation, UNetMin1 (30.22) must be larger than UNetMin2 (30.23).

# Note:

If no UPS is available, set *PwrLossTrip (30.21)* to **Immediately**. Thus the drive will trip with **F512 MainsLowVolt** avoiding secondary phenomena due to missing power for AI's and DI's.

Drive behavior during auto-reclosing

Auto-reclosing

## Mains synchronism

As soon as the main contactor is closed and the firing unit is synchronized with the incoming voltage, supervising of the synchronization is activated. If the synchronization fails, **F514 MainsNotSync** will be generated.

The synchronization of the firing unit takes typically 300 ms before the current controller is ready.

# Mains overvoltage

The overvoltage level is fixed to 1.3 \* *NomMainsVolt (99.10)*. Exceeding this level for more than 10 s and RdyRun = 1 causes **F513 MainsOvrVolt**.

## **Communication loss**

The communication to several devices is supervised. The reaction to a communication loss can be chosen by means of *LocalLossCtrl (30.27)* or *ComLossCtrl (30.28)*.

The time out is set by the parameters listed in the table as well as all dependent fault- and alarm messages.

Overview local and communication loss:				
Device	Loss control	Time out	Related fault	Related alarm
DCS800 Control Panel DW DWL	LocalLossCtrl (30.27)	fixed to 5s	F546 LocalCmdLoss	A130 LocalCmdLoss
R-type fieldbus	ComLossCtrl (30.28)	FB TimeOut (30.35)	F528 FieldBusCom	A128 FieldBusCom

Overview local and communication loss

## Fan, field and mains contactor acknowledge

When the drive is switched **On** (MCW bit 0), the firmware closes the fan contactor and waits for acknowledge. After it is received, the field contactor is closed respectively the field converter is started and the firmware waits for the field acknowledge. Finally the main contactor is closed and its acknowledge is waited for.

If the acknowledges are not received during 10 seconds after the **On** command (MCW bit 0) is given, the corresponding fault is generated. These are:

- 1. F521 FieldAck, see Mot1FexStatus (6.12)
- 2. F523 ExtFanAck, see MotFanAck (10.06)
- 3. F524 MainContAck, see MainContAck (10.21)
- 4. F527 ConvFanAck, see ConvFanAck (10.20)

## Note:

F521 FieldAck is the sum fault for all field related faults like:

- 1. F515 M1FexOverCur, see M1FldOvrCurLev (30.13)
- 2. F516 M1FexCom, see FexTimeOut (94.07)
- 3. **F529 M1FexNotOK**, fault during self-diagnosis
- 4. F537 M1FexRdyLost, AC voltage is missing or not in synchronism
- 5. **F541 M1FexLowCur**, see *M1FldMinTrip (30.12)*

# External fault

The user has the possibility to connect external faults to the drive. The source can be connected to DI's, *MainCtrlWord (7.01)* or *AuxCtrlWord (7.02)* and is selectable by *ExtFaultSel (30.31)*. External faults generate **F526 ExternalDI**.

*ExtFaultOnSel (30.33)* selects the reaction:

- 1. external fault is always valid independent from drive state
- 2. external fault is only valid when drive state is **RdyRun** (MSW bit 1) for at least 6 s

## Note:

In case inverted fault inputs are needed, it is possible to invert the DI's.

#### Bridge reversal

With a 6-pulse converter, the bridge reversal is initiated by changing the polarity of the current reference - see *CurRefUsed (3.12)*. Upon zero current detection - see *CurCtrlStat1 (6.03)* bit 13 - the bridge reversal is started. Depending on the moment, the new bridge may be "fired" either during the same or during the next current cycle.

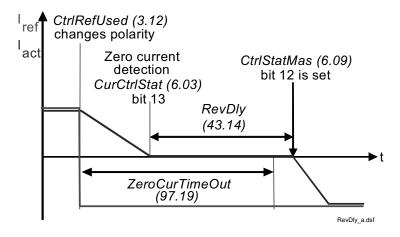

The switchover can be delayed by *RevDly (43.14)*. The delay starts after zero current has been detected - see *CurCtrlStat1 (6.03)* bit 13. Thus *RevDly (43.14)* is the length of the forced current gap during a bridge changeover. After the reversal delay is elapsed the system changes to the selected bridge without any further consideration.

This feature may prove useful when operating with large inductances. Also the time needed to change the current direction can be longer when changing from motoring mode to regenerative mode at high motor voltages, because the motor voltage must be reduced before switching to regenerative mode - see also *RevVoltMargin (44.21)*.

After a command to change current direction - see *CurRefUsed (3.12)* - the opposite current has to be reached before *ZeroCurTimeOut (97.19)* has been elapsed otherwise the drive trips with **F557 ReversalTime** [*FaultWord4 (9.04)* bit 8].

#### Example:

Drive is tripping with **F557 ReversalTime** [FaultWord4 (9.04) bit 8]:

Bridge reversal

### Analog input monitor

In case the analog input is set to 2 V to 10 V respectively 4 mA to 20 mA it is possible to check for wire breakage by means of *AI Mon4mA (30.29)*.

In case the threshold is undershoot one of the following actions will take place:

- 1. the drive stops according to *FaultStopMode (30.30)* and trips with **F551** AIRange
- 2. the drive continues to run at the last speed and sets A127 AIRange

3. the drive continues to run with *FixedSpeed1 (23.02)* and sets **A127** AIRange

# **Motor protection**

### Armature overvoltage

The nominal value of the armature voltage is set with *M1NomVolt (99.02)*.

The overvoltage level is set by means of *ArmOvrVoltLev (30.08)*. Exceeding this level causes **F503 ArmOverVolt**.

#### **Residual current detection**

The residual current detection (earth fault) is based on:

- a sum current transformer at the AC-side of the converter or
- an external device (e.g. Bender relays).

If a current transformer (ratio is 400 : 1) is used its secondary winding is connected to Al4 (X3:11 and X3:12) on the SDCS-IOB-3 board. The sum current of all three phases has to be zero, otherwise a residual current is detected and **F505 ResCurDetect** is set.

*ResCurDetectSel (30.05)* activates the residual current detection and selects the choice of connected hardware (transformer or external device).

The residual current detection tripping level, in amperes at the primary side of the current transformer, is set with *ResCurDetectLim (30.06)*, if a sum current transformer is used. In case an external device is used *ResCurDetectLim (30.06)* is deactivated.

ResCurDetectDel (30.07) delays F505 ResCurDetect.

#### Measured motor temperature

#### General

The temperatures of motor 1 and motor 2 (parameter for motor 2 see group 49) can be measured at the same time. Alarm and tripping levels are selected by means of *M1AlarmLimTemp (31.06)* and *M1FaultLimTemp (31.07)*. If the levels are exceeded **A106 M1OverTemp** respectively **F506 M1OverTemp** is set. The motor fan will continue to work until the motor is cooled down to alarm limit.

The measurement is configured by means of *M1TempSel (31.05)* and the measured temperature is shown in *Mot1TempMeas (1.22)*. The unit of the measurement depends on the selected measurement mode. For PT100 the unit is degree Celsius and for PTC the unit is  $\Omega$ .

The motor temperature measurement uses either Al2 and Al3 of the SDCS-IOB-3 or Al7 and Al8 of the RAIO. Additionally the SDCS-IOB-3 features a selectable constant current source for PT100 (5 mA) or PTC (1.5 mA).

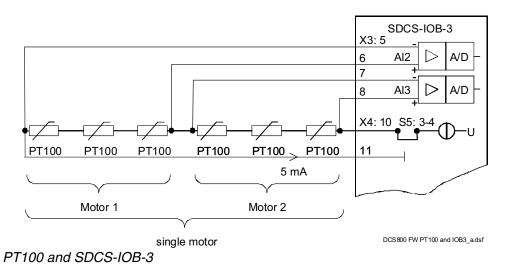

Measurement selection

Connection possibilities for PT100:

- max. 3 PT100 for motor 1 and max. 3 PT100 for motor 2 or
- up to 6 PT100 for a single motor.

### SDCS-IOB-3:

Al2 (motor 1) and Al3 (motor 2) are used for the temperature measurement with PT100. In case only one PT100 is connected to an Al the input range must be configured by jumpers to a gain of 10. Jumper settings for input range and constant current source see *DCS800 Hardware Manual*. All parameters for Al2 and Al3 in group 15 have to set to default.

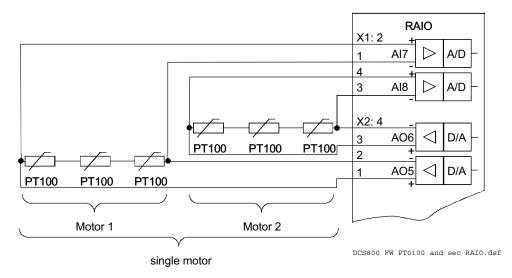

For more information see section Analog Inputs.

436

#### **RAIO** for motor temperature measurement:

AI7 (motor 1) and AI8 (motor 2) are used for the temperature measurement with PT100. AO5 and AO6 are used as current source. AI7 / AO5 and AI8 / AO6 have to be activated by means of *AIO MotTempMeas (98.12)*.

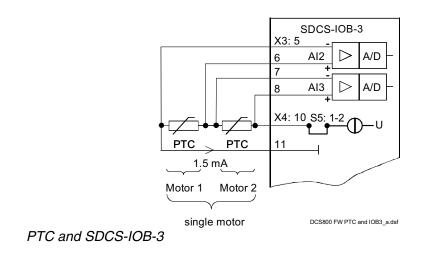

PT100 and second RAIO

#### SDCS-IOB-3:

Connection possibilities for PTC:

- max. 1 PTC for motor 1 and max. 1 PTC for motor 2 or
- up to 2 PTC for a single motor.

Al2 (motor 1) and Al3 (motor 2) are used for the temperature measurement with PTC. Jumper settings see *DCS800 Hardware Manual*. All parameters for Al2 and Al3 in group 15 have to set to default.

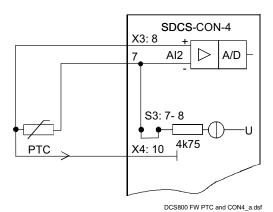

### SDCS-CON-4:

Connection possibilities for PTC:

max. 1 PTC for motor 1 or max. 1 PTC for motor 2.

Only AI2 can be used for the temperature measurement with PTC. Jumper settings see DCS800 Hardware Manual. All parameters for Al2 in group 15 have to set to default.

#### Klixon

The temperature of motor 1 and motor 2 can be supervised by means of klixons. The klixon is a thermal switch, opening its contact at a defined temperature. This can be used for supervision of the temperature by means of connecting the switch to a digital input of the drive. The digital input for the klixon(s) is selected with M1KlixonSel (31.08). The drive trips with F506 M1OverTemp when the klixon opens. The motor fan will continue to work until the klixon is closed again.

#### Note:

It is possible to connect several klixons in series.

#### Motor thermal model

General

The drive includes two thermal models one for motor 1 and one for motor 2. The models can be used at the same time. Two models are needed in case one converter is shared by two motors (e.g. shared motion). During normal operation only one thermal model is needed.

It is recommended to use the thermal model of the motor if a direct motor temperature measurement isn't available and the current limits of the drive are set higher than the motor nominal current.

The thermal model is based on the actual motor current related to motor nominal current and rated ambient temperature. Thus the thermal model does not directly calculate the temperature of the motor, but it calculates the temperature rise of the motor. This is based on the fact that the motor will reach its end temperature

after the specified time when starting to run the cold motor (40°C) with nominal current. This time is about four times the motor thermal time constant.

The temperature rise of the motor behaves like the time constant which is proportional with the motor current to the power of two:

$$\Phi = \frac{I_{act}^2}{I_{Motn}^2} * \left(1 - e^{-\frac{t}{\tau}}\right) \quad (1)$$

When the motor is cooling down, following temperature model is valid:

to ways a water way wind a

$$\Phi = \frac{I_{act}^2}{I_{Motn}^2} * e^{\frac{-\tau}{\tau}}$$
(2)

with:

$$\Phi_{alarm} = \text{temperature rise} == [M1AlarmLinL0ad (31.03)]$$
  

$$\Phi_{trip} = \text{temperature rise} == [M1FaultLinLoad (31.04)]^2$$
  

$$\Phi = \text{temperature rise} == Mot1TempCalc (1.20)$$
  

$$I_{act} = \text{actual motor current (overload e.g. 170%)}$$
  

$$I_{MotN} = \text{nominal motor current (100%)}$$
  

$$t = \text{length of overload (e.g. 60 s)}$$
  

$$\tau = \text{temperature time constant (in seconds)} == M1ModelTime (31.01)$$

 $[\Lambda d + \Lambda ] = mail instance of (0.1, 0.0)]^2$ 

As from the formulas (1) and (2) can be seen, the temperature model uses the same time constant when the motor is heating or cooling down.

#### Alarm and tripping levels

Alarm and tripping levels are selected by means of *M1AlarmLimLoad* (31.03) and *M1FaultLimLoad* (31.04). If the levels are exceeded **A107 M1OverLoad** respectively **F507 M1OverLoad** is set. The motor fan will continue to work until the motor is cooled down under the alarm limit.

The default values are selected in order to achieve quite high overload ability. Recommended value for alarming is 102 % and for tripping 106 % of nominal motor current. Thus the temperature rise is:

-  $\Phi_{alarm} == [M1AlarmLimLoad (31.03)]^2 = (102\%)^2 = 1.02^2 = 1.04$  and -  $\Phi_{trip} == [M1FaultLimLoad (31.04)]^2 = (106\%)^2 = 1.06^2 = 1.12.$ 

The temperature rise output of the model is shown in *Mot1TempCalc (1.20)*.

#### Thermal model selection

The activation of the thermal models is made by setting *M1ModelTime (31.01)* greater than zero.

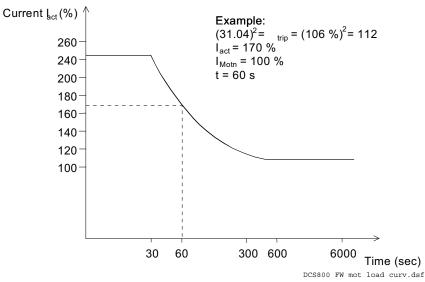

#### Thermal time constant

The time constant for the thermal model is set by means of *M1ModelTime (31.01)*. If the thermal time constant of a motor is given by the manufacturer just write it into *M1ModelTime (31.01)*.

In many cases the motor manufacturer provides a curve that defines how long the motor can be overloaded by a certain overload factor. In this case the proper thermal time constant must be calculated.

#### Example:

The drive is desired to trip if the motor current exceeds 170 % of motor nominal current for more than 60 seconds. Selected tripping base level is 106 % of nominal motor current, thus M1FaultLimLoad (31.04) = 106 %.

#### Note:

This is an example and does not necessarily correspond to any motor!

Using formula (1) we can calculate the correct value for  $\tau,$  when starting with a cold motor.

With:

$$(31.04)^{2} = \Phi_{trip} = \frac{I_{act}^{2}}{I_{Moin}^{2}} * \left(1 - e^{-\frac{t}{\tau}}\right)$$

Follows:

$$\tau = -\frac{t}{\ln\left(1 - (31.04)^2 * \frac{I_{Motn}}{I_{act}^2}\right)} = -\frac{60s}{\ln\left(1 - 1.06^2 * \frac{1.0^2}{1.7^2}\right)} = 122s$$

Set *M1ModelTime* (31.01) = 122 s.

### **Field overcurrent**

The nominal value of the field current is set with M1NomFldCur (99.11).

The overcurrent level is set by means of *M1FldOvrCurLev (30.13)*. Exceeding this level causes **F515 M1FexOverCur**.

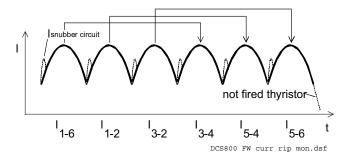

#### Armature current ripple

The current control is equipped with a current ripple monitor. This function can detect:

- 1. a broken fuse or thyristor
- 2. too high gain (e.g. wrong tuning) of the current controller
- 3. a broken current transformer (T51, T52)

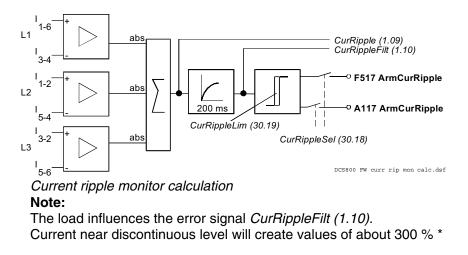

The current ripple monitor level is set by means of *CurRippleLim (30.19)*. Exceeding this level causes either **F517 ArmCurRipple** or **A117 ArmCurRipple** depending on *CurRippleSel (30.18)*.

Current ripple monitor method is based on comparing positive and negative currents of each phase. The calculation is done per thyristor pair:

Current ripple monitor method

*CurRipple (1.09)* is calculated as  $abs(I_{1.6}-I_{3.4}) + abs(I_{1.2}-I_{5.4}) + abs(I_{3.2}-I_{5.6})$ . By low-pass filtering with 200 ms *CurRippleFilt (1.10)* is generated and compared against *CurRippleLim (30.19)*.

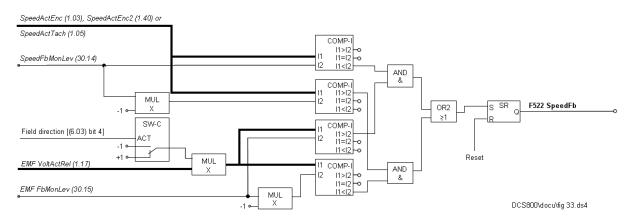

*ConvCurActRel (1.15)* if a thyristor is not fired. High inductive loads will create values of about 90% \* *ConvCurActRel (1.15)* if a thyristor is not fired.

### **Commissioning hint:**

It is not possible to pre-calculate clear levels. The current control reacts to unstable current feedback. The load is continuously driving the current if a thyristor is not fired.

## Speed feedback monitor

The speed feedback monitor supervises an attached analog tacho or encoder for proper function by means of measured speed and measured EMF. Above a certain EMF the measured speed feedback must be above a certain threshold. The sign of the speed measurement must be correct as well:

#### Speed measurement supervision

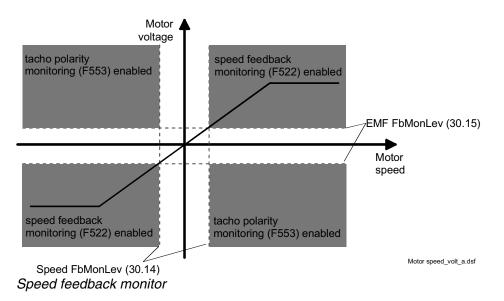

The drive reacts according to SpeedFbFltSel (30.17) when:

- 1. the measured EMF is greater than EMF FbMonLev (30.15) and
- 2. the measured speed feedback *SpeedActEnc (1.03), SpeedActTach (1.05)* or *SpeedActEnc2 (1.42)* is lower than *SpeedFbMonLev (30.14)*.

#### Example:

- SpeedFbMonLev (30.14) = 15 rpm
- EMF FbMonLev (30.15) = 50 V

The drive trips when the EMF is greater than 50 V while the speed feedback is  $\leq$  15 rpm.

SpeedFbFltSel (30.17) selects the reaction to a speed feedback problem:

- 1. the drive is immediately tripped with F522 SpeedFb
- 2. the speed feedback is switched to EMF and the drive is stopped according to *E StopRamp (22.11)*, then **F522 SpeedFb** is set
- 3. the speed feedback is switched to EMF and A125 SpeedFb is set
- This selection is only valid if 2 pulse encoders are connected. Depending on the setting of *M1SpeeFbSel (50.03)* the speed feedback is switched from pulse encoder 1 to pulse encoder 2 or vice versa in case of a problem and A125 SpeedFb [*AlarmWord2 (9.07)* bit 8] is set.

In case the field is weakened the drive is immediately tripped with **F522 SpeedFb**, except two pulse encoders are in use.

#### Stall protection

The stall protection trips the converter with **F531 MotorStalled** when the motor is in apparent danger of overheating. The rotor is either mechanically stalled or the load is continuously too high. It is possible to adjust the supervision (time, speed and torque).

The stall protection trips the drive if:

- 1. the actual speed is below StallSpeed (30.02) and
- 2. the actual torque in percent of MotNomTorque (4.23) exceeds StallTorq (30.03)
- 3. for a time longer than programmed in *StallTime (30.01)*.

### **Overspeed protection**

The motor is protected against overspeed e.g. in a case when the drive is in torque control mode and the load drops unexpected.

The overspeed level is set by means of *M1OvrSpeed (30.16)*. Exceeding this level causes **F532 MotOverSpeed**.

**Current rise** 

The protection against fast current rise during generating is configured by means of *ArmCurRiseMax (30.10)*.

Exceeding this level causes **F539 FastCurRise**. If present the DC-breaker is tripped and the main contactor is opened.

# Field undercurrent

The nominal value of the field current is set with *M1NomFldCur (99.11)*. The minimum field current level is set by means of *M1FldMinTrip (30.12)*. Undershooting this level causes **F541 M1FexLowCur**. *FldMinTripDly (45.18)* delays **F541 M1FexLowCur**.

### Tacho / pulse encoder polarity

The polarity of the analog tacho or pulse encoder [depending on *M1SpeedFbSell* (50.03)] is checked against the EMF. If the polarity is wrong **F553 TachPolarity** is generated.

### Tacho range

If an overflow of the AlTacho input is imminent **F554 TachoRange** is generated. Check for the right connections (X3:1 to X3:4) on the SDCS-CON-4.

444

# Status messages

# Display of status, fault and alarm signals

Categories of signals and display options

A seven segment display (H2500) is located on the control board SDCS-CON-4 and it shows the state of drive:

0.7s 0.7s 0.7s	<ul> <li>E01 internal FlashPROM error (check sum)</li> <li>E02 external FlashPROM error (check sum)</li> <li>E03 RAM error</li> <li>E04 RAM error</li> <li>E05 no Firmware</li> <li>E06 watchdog error</li> </ul>
8	Program is not running
	Normal situation
_	Download firmware; S5=1-2
Ь	Request + download Firmware step 2; S5=3-4
R	Alarm
F	Fault

7seg\_DCS8\_a.dsf

The seven-segment display shows the messages in code. The letters and numbers of multi-character codes are displayed one after the other for 0.7 seconds at a time. Plain text messages are available on the DCS800 Control Panel and in the fault logger of DriveWindow and DriveWindow Light.

F514 = mains not in synchronism

For evaluation via digital outputs or communication to the overriding control 16 bit words are available, containing all fault and alarm signals as binary code:

- FaultWord1 (9.01),
- FaultWord2 (9.02),
- FaultWord3 (9.03),
- FaultWord4 (9.04),
- UserFaultWord (9.05),
- AlarmWord1 (9.06),
- AlarmWord2 (9.07),
- AlarmWord3 (9.08) and

UserAlarmWord (9.09)

## **General messages**

### SDCS-CON-4

General messages will only be indicated on the seven-segment display of the SDCS-CON-4.

7- segment display	Text on DCS800 Control Panel, DriveWindow and DriveWindow Light	Definition	Remark
8	not available	firmware is not running	1
	not available	firmware is running, no faults, no alarms	-
-	not available	indication while loading firmware into SDCS-CON-4	-
d	not available	indication while loading DCS800 Control Panel texts into SDCS-CON-4	-
u	not available	DCS800 Control Panel text now formatting in the flash - don't switch off	-

# Power-up errors (E)

### SDCS-CON-4

Power-up errors will only be indicated on the seven segment display of the SDCS-CON-4. With a power-up error active it is not possible to start the drive.

7- segment display	Text on DCS800 Control Panel, DriveWindow and DriveWindow Light	Definition	Remark
E01	not available	Checksum fault firmware flash	1,2
E02	not available	SDCS-CON-4 ROM memory test error	1,2
E03	not available	SDCS-CON-4 RAM memory test error (even addresses)	1,2
E04	not available	SDCS-CON-4 RAM memory test error (odd addresses)	1,2
E05	not available	SDCS-CON-4 hardware is not compatible, unknown board	1,2
E06	not available	SDCS-CON-4 watchdog timeout occurred	1,2

- 1. Units should be de-energized and energized. If the fault occurs again check the SDCS-CON-4, SDCS-PIN-4 respectively SDCS-POW-4 boards and change them if necessary.
- 2. Power-up errors are only enabled immediately after power on. If a power-up error is indicated during normal operation the reason is usually caused by EMC. In this case please check for proper grounding of cables, converter and cabinet.

446

# Fault signals (F)

To avoid dangerous situations, damage of the motor, the drive or any other material some physical values must not exceed certain limits. Therefore limit values can be specified for these values by parameter setting which cause an alarm or a fault when the value exceeds the limits (e.g. max. armature voltage, max. converter temperature). Faults can also be caused by situations which inhibit the drive from normal operation (e.g. blown fuse).

A fault is a condition which requires an immediate stop of the drive in order to avoid danger or damage. The drive is stopped automatically and cannot be restarted before removing its cause.

All fault signals, with the exception of:

- F501 AuxUnderVolt,
- F525 TypeCode,
- F547 HwFailure and
- F548 FwFailure

are resetable in case the fault is eliminated.

To reset a fault following steps are required:

- remove the Run and On commands [UsedMCW (7.04) bit 3 and 0]
- eliminate the faults
- acknowledge the fault with Reset [UsedMCW (7.04) bit 7] via digital input, overriding control system or in Local mode with DCS800 Control Panel, DriveWindow or DriveWindow Light
- depending on the systems condition, generate Run and On commands [UsedMCW (7.04) bit 3 and 0] again

The fault signals will switch the drive off completely or partly depending on its trip level.

#### Trip level 1:

- main contactor is switched off immediately
- field contactor is switched off immediately
- fan contactor is switched off immediately

## Trip level 2:

- main contactor is switched off immediately
- field contactor is switched off immediately
- fan contactor stays on as long as the fault is pending or as long as *FanDly* (21.14) is running

#### Trip level 3:

The drive is stopping via SpeedFbFltMode (30.36), thus the

- main contactor is switched off immediately
- field contactor is switched off immediately in case of SpeedFbFltMode (30.36) = CoastStop, but it stays on in case of field heating or SpeedEbEltMode (30.36) = DynBraking
  - SpeedFbFltMode (30.36) = DynBraking
- fan contactor stays on
- At standstill the
- main contactor cannot be switched on again
- field contactor stays on in case of field heating
- fan contactor stays on as long as FanDly (21.14) is running

# Trip level 4:

As long as the drive is stopping via FaultStopMode (30.30), the

- main contactor is switched off immediately in case of *FaultStopMode* (30.30) = CoastStop or DynBraking, but it stays on in case of *FaultStopMode* (30.30) = RampStop or TorqueLimit
- field contactor is switched off immediately in case of *FaultStopMode (30.30)* = CoastStop, but it stays on in case of field heating or *FaultStopMode (30.30)* = RampStop, TorqueLimit or DynBraking
- fan contactor is switched off immediately in case of *FaultStopMode (30.30)* = CoastStop, but stays on in case of *FaultStopMode (30.30)* = RampStop, TorqueLimit or DynBraking

At standstill the

- main contactor is switched off immediately
- field contactor stays on in case of field heating
- fan contactor stays on as long as FanDly (21.14) is running

# **Trip level 5**

As long as the drive is stopping via any communication loss control [*LocalLossCtrl* (30.27), *ComLossCtrl* (30.28), *Ch0ComLossCtrl* (70.05) or *Ch2ComLossCtrl* (70.15)], the

- main contactor is switched off immediately or stays on depending on the selected communication loss control
- field contactor is switched off immediately or stays on depending on the selected communication loss control, but it stays on in case of field heating
- fan contactor is switched off immediately or stays on depending on the selected communication loss control

At standstill

- main contactor is switched off immediately
- field contactor stays on in case of field heating
- fan contactor stays on as long as FanDly (21.14) is running

In case a fault occurs, it stays active until the cause is eliminated and a **Reset** [*UsedMCW* (7.04) bit 7] is given.

# SDCS-COM-8 messages

Details of the SDCS-COM-8 messages are available in SysFaultWord (9.10).

7- segment display		Definition / Action	Fault- word	Fault is active when	Triplevel
-	OS_xx	<b>Operating system message xx:</b> An OS_xx message is an empty and thus not used message of the SDCS-COM-8 operating system. If an OS_xx message is indicated during normal operation the reason is usually caused by EMC. In this case please check for proper version of the SDCS-COM-8 (revision I and higher), grounding of cables, converter and cabinet.	-	-	-

# Alarm signals (A)

An alarm is a message, that a condition occurred, which may lead to a dangerous situation. It is displayed and written into the fault logger. However, the cause for the alarm can inhibit the drive from continuing with normal operation. If the cause of the alarm disappears the alarm will be automatically reset. The fault logger shows the appearing alarm (A1xx) with a plus sign and the disappearing alarm (A2xx) with a minus sign. An appearing user defined alarm is indicated as A3xx. A disappearing user defined alarm is indicated as A4xx.

The alarm handling must provides 4 alarm levels.

### Alarm level 1:

- the drive keeps on running and the alarm is indicated
- after the drive is stopped, the main contactor cannot be switched on again (no re-start possible)

### Alarm level 2:

- the drive keeps on running and the alarm is indicated
- fan contactor stays on as long as the alarm is pending
- if the alarm disappears FanDly (21.14) will start

### Alarm level 3:

- AutoReclosing (auto re-start) is [AuxStatWord (8.02) bit 15] active
- RdyRun [MainStatWord (8.01) bit 1] is disabled, but the drive is automatically restarted when the alarm condition vanishes
- $\alpha$  is set to 150°
- single firing pulses

### Alarm level 4:

- the drive keeps on running and the alarm is indicated

In case an alarm occurs, it stays active until the cause is eliminated. Then the alarm will automatically disappear, thus a **Reset** [*UsedMCW* (7.04) bit 7] is not needed and will have no effect.

A123	123 FaultSuppres	Fault suppressed: At least one fault message is currently active and suppressed.	9.07, bit 6	always	4
A124	124 SpeedScale	Speed scaling out of range:The parameters causing the alarm can be identified inDiagnosis (9.11).α is set to 150°; single firing pulsesCheck:-M1SpeedMin (20.01), M1SpeedMax (20.02), M2BaseSpeed (49.03), M2SpeedMin (49.19), M2SpeedMax (49.20), M2SpeedScale (49.22), M1SpeedScale (50.01), M1BaseSpeed (99.04)	9.07, bit 7	always	0
A125	125 SpeedFb	<ul> <li>Selected motor, speed feedback:</li> <li>The comparison of the speed feedback from pulse encoder or analog tacho has failed.</li> <li>Check: <ul> <li>M1SpeedFbSel (50.03), SpeedFbFltMode (30.36), SpeedFbFltSel (30.17), EMF FbMonLev (30.15), SpeedFbMonLev (30.14)</li> <li>pulse encoder: encoder itself, alignment, cabling, coupling, power supply (feedback might be too low), mechanical disturbances, jumper S4 on SDCS-CON-4</li> <li>analog tacho: tacho itself, tacho polarity and voltage, alignment, cabling, coupling, coupling, mechanical disturbances, jumper S1 on SDCS-CON-4</li> <li>EMF: connection converter - armature circuit closed</li> <li>SDCS-CON-4, SDCS-IOB-3, SDCS-POW-4</li> </ul> </li> </ul>	9.07, bit 8	always	4

7- segment display	Text on DCS800 Control Panel, DriveWindow and DriveWindow Light	Definition / Action	Alarm- word	Alarm is active when	Alarmlevel
A126	126 ExternalDI	External alarm via binary input: There is no problem with the drive itself! Check: - ExtAlarmSel (30.32), alarm = 0, ExtAlarmOnSel (30.34)	9.07, bit 9	always	4
A127	127 AIRange	Analog input range: Undershoot of one of the analog input values under 4mA / 2V. Check: - Al Mon4mA (30.29) - used analog inputs connections and cables - polarity of connection	9.07, bit 10	always	4
A128	128 FieldBusCom	Fieldbus communication loss:         F528 FieldBusCom is only activated after the first         data set from the overriding control is received by the         drive. Before the first data set is received only A128         FieldBusCom is active. The reason is to suppress         unnecessary faults (the start up of the overriding         control is usually slower than the one of the drive).         Check:         -       ComLossCtrl (30.28), FB TimeOut (30.35),         CommModule (98.02)         -       parameter settings of group 51 (fieldbus)         -       fieldbus cable         -       fieldbus termination         -       fieldbus adapter	9.07, bit 11	always if <i>FB TimeOut</i> <i>(30.35) ≠</i> 0	4
A129	129 ParRestored	Parameter restored: The parameters found in the flash were invalid at power-up (checksum fault). All parameters were restored from the parameter backup.	9.07, bit 12	always	4
A130	130 LocalCmdLoss	Local command loss: Connection fault with DCS800 Control Panel, DriveWindow or DriveWindow Light. Check: - LocalLossCtrl (30.27) - if control DCS800 Control Panel is disconnected - connection adapter - cables	9.07, bit 13	local	4
A131	131 ParAdded	Parameter added: A new firmware with a different amount of parameters was downloaded. The new parameters are set to their default values. The parameters causing the alarm can be identified in <i>Diagnosis (9.11)</i> . Check: - new parameters and set them to the desired values	9.07, bit 14	after download of firmware for max. 10 s	4

Fault tracing

7- segment display	DriveWindow and	Definition / Action	Alarm- word	Alarm is active when	Alarmlevel
A132	DriveWindow Light	<b>Parameter setting conflict:</b> Is triggered by parameter settings conflicting with other parameters. The parameters causing the alarm can be identified in <i>Diagnosis (9.11)</i> .	9.07, bit 15	always	<b>IV</b> 4
A133	133 RetainInv	Retain data invalid:         Set when the retain data in the flash are invalid during power-up. In this case the backup data are used.         Note:         The backup of the lost retain data reflects the status at the previous power-up.         Examples for retain data are:         – fault logger data,         – Data1 (19.01) to Data4 (19.04),         – I/O options (see group 98) and         – parameters defined by means of DCS800         ControlBuilder (CoDeSys) with the box         RETAIN ticked         The situation of invalid retain data occurs, if the auxiliary voltage of the DCS800 is switched off about 2 seconds after power-up (while the retain data sector is being rearranged).         Check:         – if the flash of the SDCS-CON-4 is defective and         – if the auxiliary power supply has a problem	9.08, bit 0	directly after energizing of electronics for max. 10 s	4
A134	134 ParComp	Parameter compatibility: When downloading parameter sets or during power-up the firmware attempts to write the parameters. If the setting is not possible or not compatible the parameter is set to default. The parameters causing the alarm can be identified in <i>Diagnosis (9.11)</i> . Check: – parameter setting	9.08, bit 1	after download of a parameter set for max. 10 s	4
A135	135 ParUpDwnLoad	<b>Parameter up- or download failed:</b> The checksum verification failed during up- or download of parameters. Please try again. Two or more parameter set actions were requested at the same time. Please try again.	9.08, bit 2	after up- or download of parameters for max. 10 s	4
A136	136 NoAPTaskTime	Adaptive Program task time not set: The task time for the Adaptive Program is not set, while the Adaptive Program is started. Check: - that <i>TimeLevSel (83.04)</i> is set to <b>5 ms, 20 ms,</b> <b>100 ms</b> or <b>500 ms</b> when <i>AdapProgCmd</i> <i>(83.01)</i> is set to <b>Start, SingleCycle</b> or <b>SingleStep</b>	9.08, bit 3	always	4

7- segment display	Text on DCS800 Control Panel, DriveWindow and	Definition / Action	Alarm- word	Alarm is active when	rmlevel
	DriveWindow Light				Ala
A137	137 SpeedNotZero	<ul> <li>Speed not zero:</li> <li>Re-start of drive is not possible. Speed zero [see <i>M1ZeroSpeedLim (20.03)</i> or <i>M2ZeroSpeedLim (49.04)</i>] has not been reached. In case of an alarm set On = Run = 0 and check if the actual speed is within the zero speed limit.</li> <li>This alarm is valid for: <ul> <li>normal stop, Off1N [UsedMCW (7.04) bit 0] in case <i>FlyStart (21.10)</i> = StartFrom0,</li> <li>Coast Stop, Off2N [UsedMCW (7.04) bit 1],</li> <li>E-stop, Off3N [UsedMCW (7.04) bit 2] and</li> <li>if the drive is de-energized and then reenergized.</li> </ul> </li> <li>Check: <ul> <li><i>M1ZeroSpeedLim (20.03)</i></li> <li><i>FlyStart (21.10)</i></li> <li><i>M1SpeedFbSel (50.03)</i></li> <li><i>M2SpeedFbSel (49.24)</i></li> <li><i>M2ZeroSpeedLim (49.04)</i></li> </ul> </li> </ul>	9.08, bit 4	Not active if RdyRef = 1	1
		<ul> <li>for proper function of the used speed feedback devices (analog tacho / encoder)</li> </ul>			
A138	138 Off2FieldBus	Off2 (Emergency Off / Coast Stop) pending via MainCtrlWord (7.01) / fieldbus - start inhibition: There is no problem with the drive itself! Check: - MainCtrlWord (7.01) bit1 Off2N	9.08, bit 5	RdyRun = 1	1
A139	139 Off3FieldBus	Off3 (E-stop) pending via MainCtrlWord (7.01) / fieldbus: There is no problem with the drive itself! Check: - MainCtrlWord (7.01) bit2 Off3N	9.08, bit 6	RdyRun = 1	1
A140	140 IllgFieldBus	Illegal fieldbus settings: The fieldbus parameters in group 51 (fieldbus) are not set according to the fieldbus adapter or the device has not been selected. Check: – group 51 (fieldbus) – configuration of fieldbus adapter	9.08, bit 7	always	4
A141	141 COM8FwVer	SDCS-COM-8 firmware version conflict: Invalid combination of SDCS-CON-4 firmware and SDCS-COM-8 firmware. Check: - for valid combination of SDCS-CON-4 [ <i>FirmwareVer</i> (4.01)] and SDCS-COM-8 [ <i>Com8SwVersion</i> (4.11)] firmware version according to the release notes	9.08, bit 8	always	4

#### Notices

A notice is a message to inform the user about a specific occurrence which happened to the drive.

Text on DCS800 Control Panel	Definition / Action
718 PowerUp	Energize electronics:
•	The auxiliary voltage for the drives electronics is switched on
719 FaultReset	Reset: Reset of all faults which can be acknowledged
801 APNotice1	User defined notice by Adaptive Program
802 APNotice2	User defined notice by Adaptive Program
803 APNotice3	User defined notice by Adaptive Program
804 APNotice4	User defined notice by Adaptive Program
805 APNotice5	User defined notice by Adaptive Program
AccessDenied	Access to Memory Card:
	Access to Memory Card is denied, due to another access
ParNoCyc	Cyclic parameters:
,	A non cyclical parameter is written to (e.g. the overriding control writes cyclical on a non cyclical parameter). The parameters causing the notice can be identified in <i>Diagnosis</i> (9.11).
PrgInvMode	Adaptive Program not in Edit mode:
-	Push or Delete action while the Adaptive Program is not in Edit mode
	Check:
	– EditCmd (83.02)
	– AdapProgCmd (83.01)
PrgFault	Adaptive Program faulty:
0	Adaptive Program faulty
	Check:
	– FaultedPar (84.02)
PrgProtected	Adaptive Program protected:
Ū	Adaptive Program is protected by password and cannot be edited Check:
	– PassCode (83.05)
PrgPassword	Adaptive Program wrong password:
g. deenerd	Wrong password is used to unlock the Adaptive Program
	Check:
	– PassCode (83.05)

DCS800-R Rebuild Kit	j
Digital control-kit for existing	

20 ... 20,000 A<sub>DC</sub> 0 ... 1,160 V<sub>DC</sub> 230 ... 1,200 V<sub>AC</sub> IP00

- Compact
- Highest power ability
- Simple operation
- Comfortable assistants, e.g. for commissioning or fault tracing
- Scalable to all applications
- Free programmable by means of integrated IEC61131-PLC
- Individually adaptable to customer requirements
- User-defined accessories like external PLC or automation systems can be included
- High power solutions in 6- and 12-pulse up to 20,000 A, 1,500 V
- In accordance to usual standards
- Individually factory load tested
- Detailed documentation
- DCS800 module with all necessary accessories mounted and fully cabled on a panel
- Very fast installation and commissioning
- Squeezes shut-down-times in revamp projects to a minimum
